Preliminary remark

TwinLife, the research project funded by the German Research Foundation, is an ongoing 12-year representative behaviour genetic study investigating the development of social inequality. Since the project started in 2014, approximately 4,000 pairs of twins and their families have been interviewed yearly at different stages of their lives.

During the first funding period (2013-2016), the 4,000 same-sex twins as well as their families had already been interviewed personally (F2F 1a and F2F 1b) and in some cases by phone (CATI 1a). infas was then commissioned in May 2016 to conduct the interviews during the second funding period from 2016 to 2018. The second funding period includes the face-to-face interviews of wave 2 (F2F 2a and F2F 2b) as well as subsample b of the telephone interviews of wave 1 (CATI 1b) and subsample a of the telephone interviews of wave 2 (CATI 2a).

This technical report documents the stages of implementing and conducting the face-to-face interviews of the second wave (F2F 2a and F2F 2b). The report describes the sample, the respondents and the survey instruments. Chapters 5, 6 and 7 provide a description of the survey process and document the fieldwork results. Chapter 8 contains a description of the data processing steps. All fieldwork documents can be found in the annex.

1 Study design

The sample of the twin family study “TwinLife” consists of 4,000 pairs of identical or same-sex fraternal twins who were selected using a probability-based sampling design and first interviewed in 2014. Only twins growing up together or having grown up together were selected for the study. The sample consists of four age cohorts. At the time of the first interview in 2014, the youngest age cohort (year of birth 2009/2010) was 5 years old while the oldest age cohort (year of birth 1991-1993) was 23/24 years old.

Each age cohort is divided into two birth sub-cohorts. The two birth sub-cohorts of each age cohort are interviewed one after the other over two consecutive years in order to guarantee that all twins of one age cohort are interviewed at the same age. The first birth sub-cohorts of each age cohort are aggregated in subsample a, while the second birth sub-cohorts of each age cohort are aggregated in subsample b. Thus, each data collection consists of the two subsamples a and b.

As part of the extended family design of the study, the twins, as well as their parents (biological and step-parents), a sibling¹ and the current partner of the older twins (18 years of age or older) were interviewed. Personal interviews (also called face-to-face (F2F) interviews) and telephone interviews (CATI) are conducted in alternate years.

The following overview shows the survey design of the second funding period.

Tabelle 1 Overview of the surveys of the second funding period

Wave	Data collection mode	Birth cohort and fieldwork phase	
		Subsample a (twins of the first birth sub-cohorts) (C1: 2009, C2: 2003, C3: 1997, C4: 1990-1991)	Subsample b (twins of the second birth sub-cohorts) (C1: 2010, C2: 2004, C3: 1998, C4: 1992-1993)
First wave	CATI	CATI 1a <i>not part of the second funding period</i>	CATI 1b 11/2016 – 04/2017
Second wave	F2F	F2F 2a 11/2016 – 05/2017	F2F 2b 09/2017 – 04/2018
Second wave	CATI	CATI 2a 09/2017 – 04/2018	CATI 2b <i>not part of the second funding period</i>

¹ If there were several siblings in the family, the sibling relevant for the survey was selected in the first interview. This sibling will also be interviewed in the subsequent survey waves.

The subject of this technical report is the F2F interviews conducted in the second wave (F2F 2a and F2F 2b).

During the F2F surveys, all respondents aged 5 years and older were interviewed. Individual family members who had not yet taken part in the TwinLife study were also interviewed.

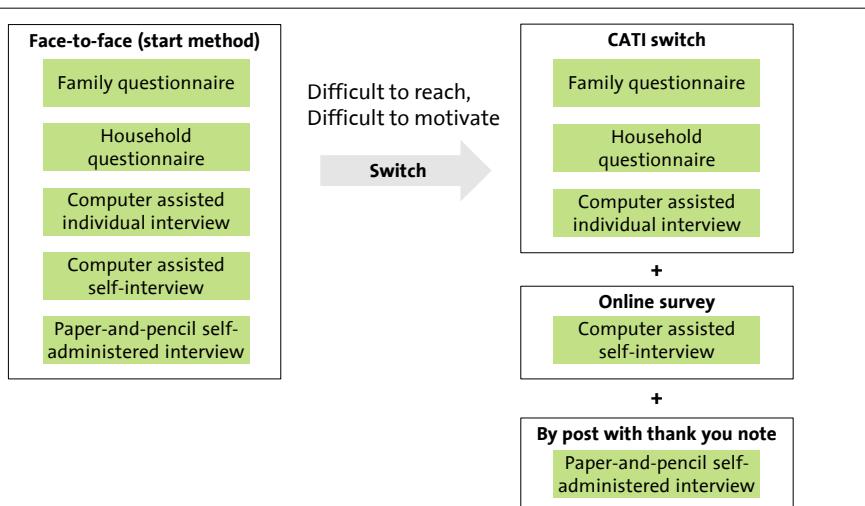

The individual interviews consisted of a computer-assisted personal interview (CAPI) administered by the interviewer, a computer-assisted self-interview (CASI) on tablets and a paper-and-pencil self-administered interview (PAPI). In addition, the children's medical check-up booklets as well as current school reports were recorded and a delayed gratification experiment was conducted with the twins in the youngest age cohort.

For the first subsample (F2F 2a), the fieldwork phase lasted from November 2016 to September 2017. The fieldwork phase of the second subsample (F2F 2b) lasted from September 2017 to May 2018.

The survey design of the F2F interviews originally intended all respondents to be interviewed personally in their homes. However, at the end of the scheduled fieldwork phase, those participants who could not be reached in the F2F field or could not be motivated to participate were asked to take part in a telephone interview instead (CATI switch). Following the telephone interview, the respondents were asked to answer an online questionnaire (computer-assisted web interview (CAWI)) as a substitute for the CASI questionnaire. The paper-and-pencil questionnaire (PAPI) was included in the thank you letter for these respondents.

The following illustration describes the design of the second F2F survey.

Abbildung 1 Survey design

Source: infas, own visuals

All families received a letter announcing that they would be contacted by an interviewer to arrange a date for the household interview. In the letter, a hotline free of charge was named as well as a study-specific email-address. For more information on the TwinLife project, the families were referred to the TwinLife study website. A newsletter containing results from the first interviews was also enclosed with the letter. As an incentive, all respondents received a thank you letter with 10 euros in cash after the successful interview. Table 2 provides an overview of the design of the second F2F survey.

Tabelle 2 F2F 2a/b study synopsis

Fieldwork phase	F2F 2a (incl. CATI switch): 11/07/2016 to 09/29/2017 F2F 2b (incl. CATI switch): 09/04/2017 to 05/27/2018
Selected population	German-speaking families with a pair of same-sex twins in four age cohorts (C1: 2009-2010, C2: 2003-2004, C3: 1997-1998, C4: 1990-1993)
Gross sample	F2F 2a: n= 1,914 families with 3,786 twins F2F 2b: n= 1,986 families with 3,956 twins
Communication strategy	<ul style="list-style-type: none"> - Letter, data protection notice, and newsletter in advance of the F2F interview (addressed to the parents (C1/C2) or twins (C3/C4)) - Thank you letter with incentive (10 euros) - 2017: Easter card as part of panel tracking (one for each household) - 2017: Christmas card incl. raffle as part of panel tracking (one for each household) - 2018: Summer card as part of panel tracking (one for each household)
Data collection mode	<ul style="list-style-type: none"> - F2F interview: CAPI, CASI and PAPI; - Telephone interview (CATI switch incl. CAWI and PAPI) for those not reached or difficult to motivate
Target persons	<ul style="list-style-type: none"> - Both twins - Their biological parents - The partner of a parent living in the household (step-parent) - A sibling (5 years or older) - Partners of the twins, provided the twins are at least 18 years old

² Cases were excluded from the analysis if the interviews were implausibly long or short. This was caused by, e.g., the interviews being interrupted or the interviewer going back within the survey instrument.

³ The duration of the paper-and-pencil self-administered interview (PAPI) is not included in these durations. It took an average of ten minutes to complete the questionnaire.

2 Conducting the pre-test and pre-test results

In preparation of the F2F 2 main survey, a pre-test was conducted to assess how manageable and useable the instrument was. A special focus of the pre-test was the succession of the different questionnaire components as well as the practicability of interviewing numerous respondents at once. Furthermore, the time needed to conduct the interviews in each family was evaluated.

Tabelle 3 F2F 2a/b pre-test study synopsis

Fieldwork phase	08/06/2016 – 08/28/2016
Selected population	German-speaking families with a pair of same-sex twins in four age cohorts (C1: 2009-2010, C2: 2003-2004, C3: 1997-1998, C4: 1990-1993)
Gross sample	72 families with 144 twins who took part in the F2F pre-test study of the first data collection and have not refused to participate since
Communication strategy	<ul style="list-style-type: none"> - Letter and data protection notice addressed to parents (C1/C2) or twins (C3/C4) - Thank you letter with incentive (50 euros for the families in C1/C2 and 30 euros for each twin in C3/C4)
Data collection mode	F2F interview: CAPI, CASI and PAPI
Respondents	<ul style="list-style-type: none"> - Both twins - Their biological parents - The partner of a parent living in the household (step-parent) - A sibling (5 years or older) - Partners of the twins, provided the twins are at least 18 years old

Interview duration ⁴ (on average)	<ul style="list-style-type: none"> - Instrument duration (CAPI+CASI) per family: Ø 204.0 minutes - Time needed to conduct the interviews per family: Ø 150.0 minutes
Interviewer deployment	n=10 interviewers
Interviewer training	2-day training session by infas project management and the TwinLife team
Valid net interviews	43 families with 160 individual interviews, 81 of which with twins
Data delivery	Delivery of survey data (incl. photos of school reports) on 09/09/2016

In a panel study, the respondents from the first interview form the starting point for the sample of the following waves. The pre-test sample of this data collection therefore consisted of 72 families with same-sex twins in four age cohorts who had participated in the pre-test of the F2F interviews of wave 1 and had not revoked their willingness to stay in the TwinLife panel study. In accordance with the communication strategy of the main survey, the letter informing the fami-

⁴ Cases were excluded from the analysis if the interviews were implausibly long or short. This was caused by e.g., the interviews being interrupted or the interviewer going back within the survey instrument. One percent of cases in the upper and lower distribution margin were excluded from the calculations.

lies about the F2F interview was addressed to the parents (C1 and C2) or to the twins (C3 and C4).

For the pre-test, ten interviewers were trained over two days by the infas project management and members of the TwinLife team. The interviewers were selected considering the distance to the sample addresses and according to their availability during the short pre-test phase. Another important selection criterion was the interviewers' experience. All of the selected interviewers had been working for infas for many years and therefore had extensive experience. In addition to the personal training, each interviewer received a study handbook.

During the three weeks of the pre-test fieldwork phase from 08/06/2018 to 08/28/2018, interviews were conducted with 160 respondents in 43 families (see table 4). 81 twins, three partners of twins, 12 siblings, 62 biological parents as well as two step-parents were interviewed. Both twins and at least one parent were interviewed in 37 families.

Tabelle 4 Interviews in the pre-test by person category

	Total	Cohort 1	Cohort 2	Cohort 3	Cohort 4
Total: Families	43	11	14	10	8
Families with both twins and at least one parent	37	11	13	9	4
Total: People, of which:	160	46	55	36	23

– Mother	38	11	14	9	4
– Father	24	7	8	5	4
– Step-parents	2	1	1	0	0

Source: Pre-test survey data

After the interview, the respondents received a thank you letter including the incentive. For the pre-test, a higher incentive was selected to motivate as many families as possible to participate within a short time period. In the age cohorts 1 and 2, the incentive of 50 euros was sent to the parents of the twins in cash. In cohorts 3 and 4, the incentive of 30 euros was sent to each twin in cash.

The interviewers were asked to complete an interviewer questionnaire for each family interviewed in the pre-test. The succession of the different questionnaires, the manageability/usability of the tablets as well as feedback to the individual questionnaires were the subject of this interviewer questionnaire. n=41 interviewer reports were included in the pre-test analyses.

The feedback of the interviewers mainly mentioned the long duration of the interview and unclear phrasing of certain questions, particularly in the questionnaire for children under 10 years of age. The pre-test also showed that conducting the individual interview components simultaneously (see chapter 4.1)

caused disturbances if questions were ambiguous or terms were unclear. The recommendation for revisions after the pre-test therefore mainly referred to the wording of the questions in the self-administered questionnaires. Only a few interviewers reported problems concerning the handling of the tablet by the respondents (around 5 percent).

Another focus of the pre-test was whether or not a paper-and-pencil self-administered questionnaire (PAPI) was necessary or if the questionnaire could be integrated into the computer-assisted self-interview (CASI). The feedback from the interviewers showed that the paper questionnaires proved to be useful in households with more than one respondent, as they could be used flexibly during the interview to bridge the waiting times for the respondents.

The experiences from the pre-test were discussed with the TwinLife team and the interviewers during a debriefing session on 09/01/2016. Afterwards, the survey data from the pre-test as well as the feedback from the interviewers were made available to the TwinLife team.

3 Sample

3.1 Description of the gross sample

The respondents from the first interview form the starting point for the sample in a panel study. The gross panel sample therefore includes twins that were interviewed in the initial F2F survey (F2F 1a and F2F 1b).⁵ However, only those pairs of twins who consented to be interviewed again were available for the following survey waves.

The F2F interviews of wave 1 were conducted by TNS Infratest in Munich. In order to pass on the addresses to infas, the permission of the respondents was required. All respondents were therefore informed in writing about the change of the survey institute and the associated disclosure of the addresses and had the opportunity to object to this.

Therefore, the gross sample of the second F2F survey consisted only of twins and their families who expressed their willingness to participate in the panel study and did not object to the transfer of their addresses to infas.

The final sample of the F2F 2 survey included a total of 3,900 families with 7,742 twins. Of these, 1,914 families and 3,786 twins were part of subsample a (F2F 2a) and 1,986 families with 3,956 twins were part of subsample b (F2F 2b).

In 58 out of 3,900 families either one or both twins objected to their address being passed on or withdrew their willingness to participate in the panel. In consultation with the TwinLife team, the families of these twins were not excluded from the panel study. The twin who was still willing to be interviewed as well as the rest of the family members thus remained in the panel. The twins who had withdrawn their willingness to be in the panel were not contacted.

⁵ In the first F2F survey (F2F 1), interviews with families were only considered valid if at least both twins and one biological parent were interviewed successfully.

3.2 Target persons

The design of the TwinLife study intends for the following family members to be interviewed:

- Both twins
- Both biological parents
- Step-parents/partners of the biological parents provided they live in the same household as the biological parent
- One sibling aged 5 years or older for each pair of twins (regardless of whether this is a full, half, adoptive or step-sibling),⁶
- Current partner of a twin (only for twins over 18 years of age).

All of these target persons were supposed to be interviewed during the F2F survey, regardless of whether the person took part in wave 1 or not. Therefore, panel interviews as well as first-time interviews were conducted.⁷

Abbildung 2 Target persons in TwinLife

Source: infas, own visuals

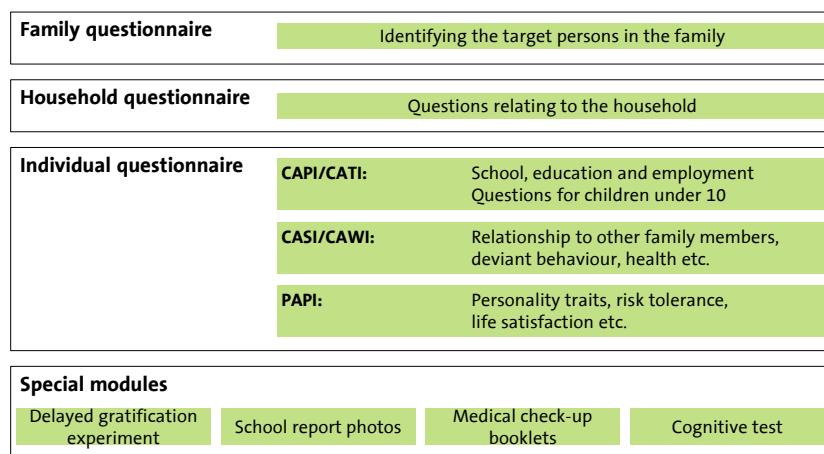

⁶ If there were several siblings in the family, the sibling relevant for the survey was selected in the first interview. This sibling will also be interviewed in the subsequent survey waves.

⁷ At least both twins and one biological parent were interviewed in the families in the first wave.

4 Survey instruments

As can be seen in figure 3, the F2F interviews consisted of different components. In addition to the family and household questionnaire, the individual interviews consisted of a computer-assisted personal interview (CAPI) administered by an interviewer, a computer-assisted self-interview (CASI) on tablets and a paper-and-pencil self-administered questionnaire (PAPI).

Abbildung 3 Overview of survey instruments

Source: infas, own visuals

The F2F survey instrument included the following components:

- **Family questionnaire:** The family questionnaire was used in the twins' households to identify the target persons (i.e., the family members that were supposed to be interviewed).
- **Household questionnaire:** The household questionnaire was used in each household with at least one target person and contained questions relating to the whole household.
- **Personal interview (CAPI/CATI):** The personal interview was conducted with all respondents aged 5 years and older.
- **Delayed gratification:** The delayed gratification experiment was only conducted with the twins of age cohort 1.
- **School report photos:** School reports were photographed if the respondent attended a school at the time of the interview.

- **Medical check-up booklets:** The information from the child medical check-up booklets was only asked for if it had not been collected in the previous interview⁸.
- **Cognitive test:** The cognitive test was only conducted with respondents who were interviewed for the first time.
- **Computer-assisted self-interview (CASI/CAWI):** The computer-assisted self-interview was answered by respondents aged 10 years or older.
- **Paper-and-pencil self-administered interview (PAPI):** The paper-and-pencil interview was completed by respondents aged 10 years or older.

4.1 Overview of the interview process

As the twins in cohort 1 and cohort 2 were only 7 and 14 years old, their parents were contacted first. The twins from cohort 3 and cohort 4 were contacted directly.

Before any individual interview could be conducted, the family and household questionnaires had to be answered. The family questionnaire was used to identify the target persons within the families and to further assess the household constellations of the families. It was conducted only in the twins' households.

After the family and household questionnaires were completed, individual interviews were conducted with all respondents of the household aged 5 years or older. The individual interviews consisted of different components: The interview began with a questionnaire administered by an interviewer (CAPI). Only after completing this questionnaire the computer-assisted self-interview (CASI) on a tablet was started. In general, the paper-and-pencil self-administered interview (PAPI) was answered after completing the CASI. However, it was also possible to answer this questionnaire at any other point during the interview.

The family members relevant for the TwinLife survey can either live all together in the same household (this was generally the case in cohorts 1 and 2) or live in different households (more common in cohorts 3 and 4). The study design took this into account by allowing up to 5 people being interviewed at the same time. To achieve this, each interviewer was equipped with a laptop, two tablets and the paper questionnaires.

This allowed for the following interview situation: While the CAPI-interview was conducted with one of the twins, two other respondents were able to answer the self-administered questionnaire (CASI) on the tablets and the sibling answered the paper-and-pencil questionnaire. In doing this, the total amount of time required to interview a household was reduced, particularly in large households.

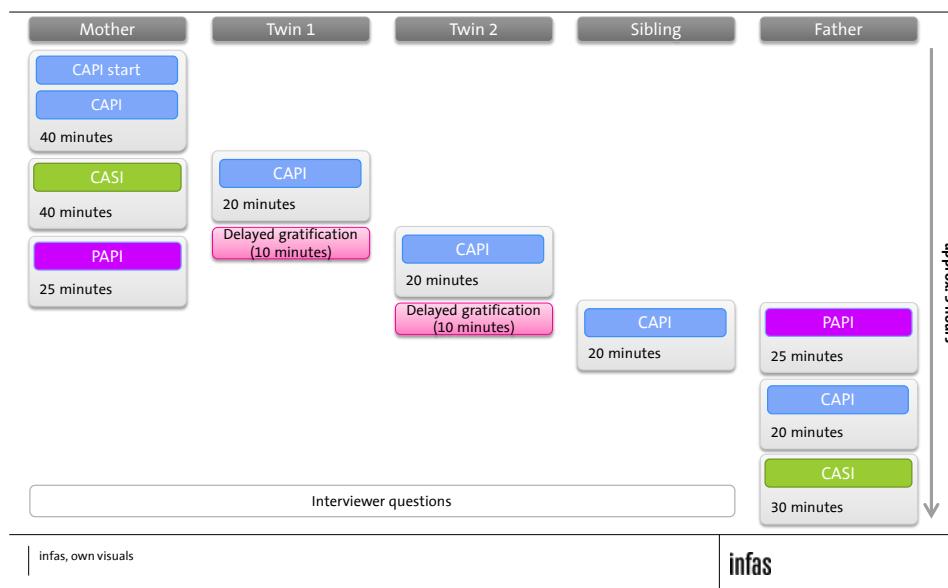

⁸ Brix et al. (2017): A longitudinal twin family study of the life course and individual development (TWINLIFE). TwinLife Technical Report Series No. 05, October 2017.

The succession of the different interview components was managed by the interview software on the interviewer's laptop. Therefore, the interviewer could always see which component of the interview was intended for which respondent as well as the order in which these should be conducted. This was the only way to ensure the data quality of the various questionnaire modules as well as the completeness of the individual interviews. Depending on the situation in the household, the order of the individual interviews could vary.

Conducting multiple interviews simultaneously meant that the total interview duration in households with several respondents could be reduced. In single-person households or if not all respondents of a household were present at an appointment, the personal interviews were conducted individually.

In cohorts 1 and 2, the respondents generally lived together in one household.⁹ The interviews always started with a parent answering the family and household questionnaires (CAPI start). Afterwards, the CAPI was conducted with this parent. At the end of the CAPI questionnaire, the variables needed to control the questions asked in the CASI questionnaire were transmitted from the laptop to the tablet using a QR code. While the parent completed the self-administered questionnaire on the tablet as well as the paper questionnaire, the interviewer was able to conduct the CAPI questionnaire with one of the two twins or any other target respondent. Figure 4 shows a typical interview situation in a cohort 1 family.

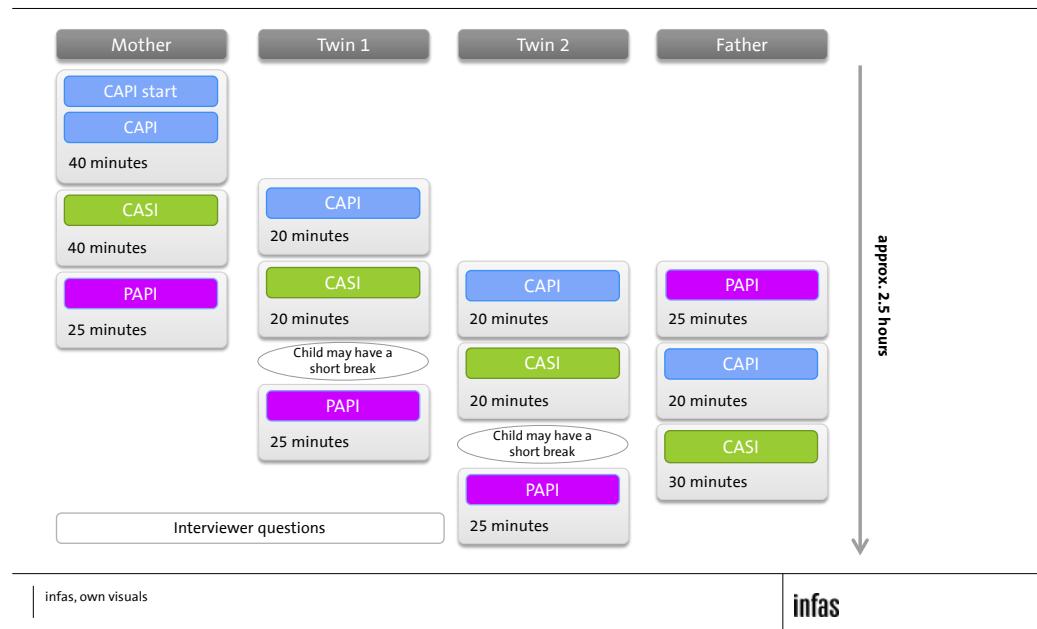

Abbildung 4 Exemplary interview situation (cohort 1)

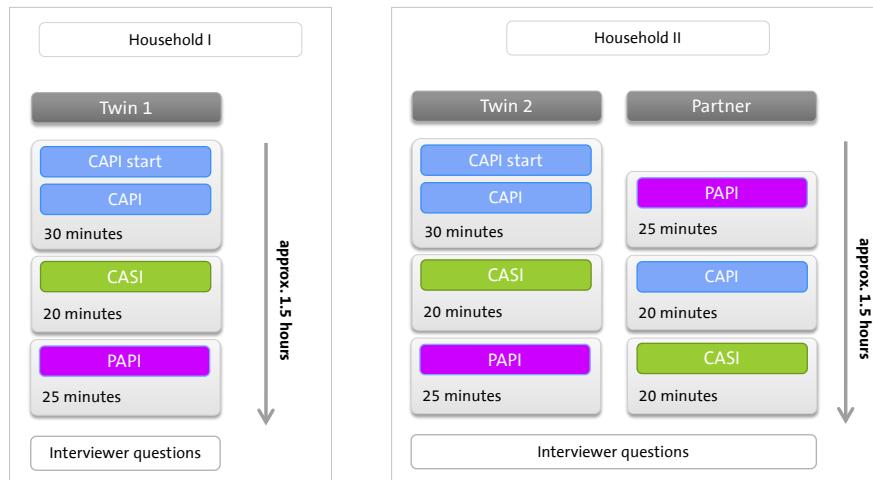

⁹ Exceptions include biological parents who lived separately or siblings who lived in another household.

Since two tablets were available, the first twin (if 10 years or older) could also begin the CASI after the CAPI interview, while the interviewer continued with the second twin or sibling (see figure 5).

Abbildung 5 Exemplary interview situation (cohort 2)

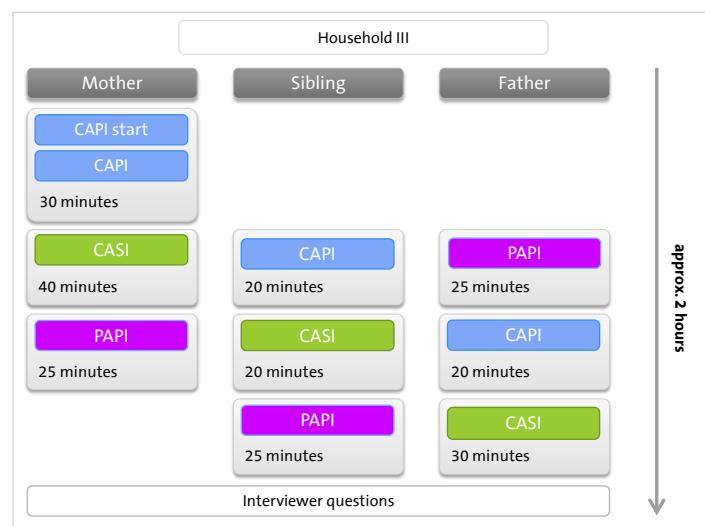

In cohorts 3 and 4, the family was contacted via the twins themselves. Interviews of several persons in one household could also be conducted simultaneously in these cohorts (see figures 6 and 7). However, in these cohorts it was more common that the twins no longer lived in the same household as their parents. Therefore, individual interviews in one-person households were more common.

Abbildung 6 Exemplary interview situation (cohorts 3/4): Households I and II

infas, own visuals

infas

Abbildung 7 Exemplary interview situation(cohorts 3/4): Household III

infas, own visuals

infas

4.2 Family questionnaire

In each family, the interview started with the family questionnaire. The family questionnaire was used to identify the target persons in the families (see section 3.2) and to document the household constellations of the families (see figure 8).

In cohorts 1 and 2, the family questionnaire was completed by the mother or father of the twins. In cohorts 3 and 4, the family questionnaire was completed either by a twin or a parent.

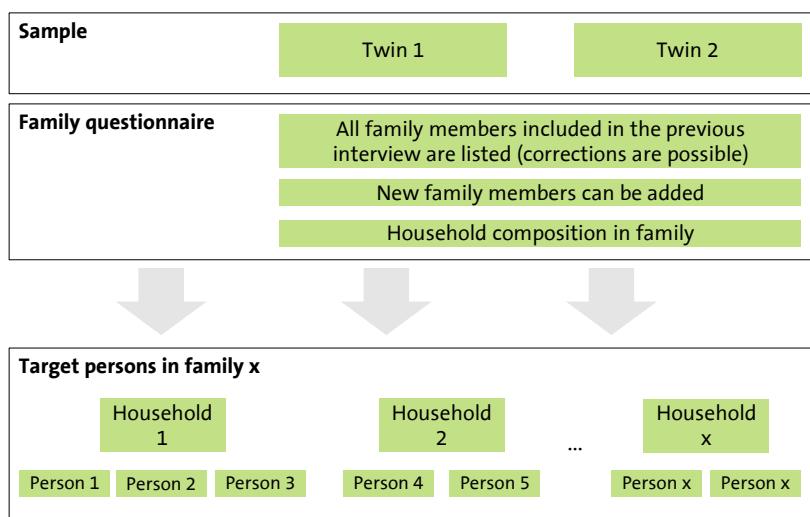

Since all the families had already been interviewed about one year earlier, pre-load information (e.g., name, date of birth, gender and the relationship to the twins) were displayed for all family members already known from the previous wave. If necessary, this information was corrected or supplemented by the interviewer. The family questionnaire also recorded family members who had not yet been recorded, such as a new partner of a biological parent.

The following family members were supposed to be included in the family questionnaire:

- Both twins
- All siblings of the twins (biological, adoptive, half or step-siblings)
- Mother (biological, adoptive or foster mother)
- Father (biological, adoptive or foster father)
- Stepfather or partner of the mother
- Stepmother or partner of the father
- Partners of the twins (only in cohorts 3 and 4)
- Children of the twins

The family members relevant for the survey could either live together in one household or live in different households. The family's household constellations were also recorded in the family questionnaire. For all households with at least one target person, the current address and telephone number was recorded.

Abbildung 8 Family questionnaire: Identifying the target persons and households

Source: infas, own visuals

infas

4.3 Household questionnaire

The household questionnaire had to be answered for each household with at least one target person by a household member over 16 years of age. It contained questions on the current living situation and the relationship between the individual family members. Other people (e.g., grandparents) who were living in the household but had not yet been registered in the family questionnaire were also recorded.

4.4 Computer-assisted personal interview

The computer-assisted personal interview (CAPI) questionnaire was intended for all respondents who were at least 5 years of age. This questionnaire included questions on school, education, and occupation. Showcards were used to assist the CAPI interview. For children under 10 years of age, the showcards were presented with age-appropriate pictures.

The topics of the CAPI questionnaires are documented in table 8. Not all respondents received questions from all topics. Questions about school and the school context, for example, were only asked if the respondent attended a school at the time of the interview.

Tabelle 8 Modules of the CAPI personal questionnaire

School and employment	Citizenship/migration School attendance School qualification Repeating/skipping a year Employment/non-employment Strain in the workplace Job autonomy Education and educational aspirations
School, job and participation	Motivation: Intrinsic motivation/motivation to learn/performance motivation School context, school environment, pressure and strain, involvement of parents Social capital, thoughts and feelings, conflicts and truths Social networks Experience with discrimination Political participation, political interest Intentional level / future plans Parent about child: Motivation
Children under 10 years of age	School attendance Motivation: Intrinsic motivation/motivation to learn/performance motivation Arguments between parents Locus of control Victimisation, bullying Deviant behavior Home environment Twin-specific questions
Cognitive test	Only for first-time respondents: CFT 1 R (under 10 years of age) or CFT 20 R (10 years of age or older)
Medical check-up booklet module	Documenting information from medical check-up booklets of twins and sibling
Photographing school reports	Photographing most current yearly school report if the child currently attends school
Delayed gratification	For twins in age cohort 1

4.4.1 Collecting information from the medical check-up booklets

The information from the medical check-up booklets of the twins and the sibling relevant for the survey were collected during the first F2F survey (F2F 1). If the booklet was not available at that time or specific information was not collected, this was obtained in the current interview.

During the CAPI interview with one of the parents, the survey program automatically checked whether it was necessary to collect the information from the medical check-up booklets. If the information was to be collected, the parent was asked to provide the documents of the children. The interviewer then transferred the information from the medical check-up booklet into the CAPI interview program.

4.4.2 School report photos

A photo of the most current yearly school report was to be taken for those twins and siblings who attended a general education school at the time of the survey. The parents of the children under 18 years of age or the respondents over 18 years of age were asked for the permission to do so. A photo of the report was then taken using one of the tablets.

If it was not possible to take a photograph of the report - either because the permission was not granted or the report was not available in the household - the grades for German and Math were asked for and recorded.

4.4.3 Delayed gratification experiment in cohort 1

After the personal interview (CAPI), the delayed gratification experiment was conducted with the twins from age cohort 1. For this purpose, the children were given one sweet (one small package of gummy bears) and were given the choice of either eating them now or receiving a second sweet (another small package of gummy bears) if they could wait without eating the first package. The aim of this experiment was to measure the ability to resist an immediate reward in order to receive a larger reward at a later point in time.

The experiment was only conducted if a parent had given its consent beforehand. The interviewer asked for permission for each twin separately, therefore either both twins or just one twin could take part in the experiment. The experiment was conducted with each twin individually after the CAPI interview. Since gummy bears were used for the experiment, the parents were asked beforehand whether the child liked gummy bears or not. The experiment was not conducted if the child did not like gummy bears.¹⁰

¹⁰ On request, the experiment could also be conducted with gummy bears without gelatine.

The parents were asked not to influence the twins before, during and after the experiment (e.g., by encouraging the children to wait or making negative comments about not waiting). The twins themselves were also asked not to talk about the result at the end of the experiment until both twins had completed the experiment.

The experiment had to be conducted in a separate room without any distractions. In this room, there had to be no food available to the child and the television, computer, mobile phones and tablets had to be switched off or removed from the room. The interviewer explained to the child that he or she would receive another small package of gummy bears as a reward if he or she could wait and not eat the gummy bears until the interviewer and the parents returned. The waiting time was ten minutes, which the child was not told in advance. The child had to wait alone in the room for this time span and the interviewer and the parents left the room during this time.

After ten minutes, the interviewer documented whether any gummy bears were missing. The child was asked why he or she did or did not eat the gummy bears. If the child did not eat any gummy bears during the waiting time, the child received both the small package of gummy bears that was used for the experiment and a second small package of gummy bears as a reward.

The experimental situation and the result of the experiment were documented in the interviewer questions shown in table 9.

Tabelle 9 Interviewer questions for the delayed gratification experiment

Contents

Did the child leave the room and if yes, when?

What did the table look like where the child was waiting - before?

What did the table look like where the child was waiting - after?

Were there any anomalies/disturbances during the experiment? If yes, which?

4.4.4 Cognitive test for first-time respondents

During the first F2F interviews (F2F 1), two tests to determine basic intelligence were conducted¹¹:

- the Culture Fair Intelligence Test (CFT 1-R¹²) for children up to 10 years of age, and
- the Culture Fair Intelligence Test (CFT 20-R¹³) for people aged 10 years and older.

As already mentioned above, in the current survey, the tests were only conducted with respondents who had not participated in the first F2F survey (first-time respondents).

The CFT 1-R test for children up to 10 years of age was conducted using a written test booklet. Since all of the twins were interviewed in the first survey wave¹⁴, this test was only conducted with first-time participating siblings under the age of 10. The CFT 1-R test is comprised of three parts: (a) series continuation, (b) classifications and (c) matrices. Before each part of the test, the interviewer introduced the types of tasks. During each part of the test, the child had the option of taking another minute in addition to the regular test time of three minutes. By using a differently colored pen, it was clear which solutions and changes the child had made in the additional minute.

The CFT 20-R test for respondents 10 years or older was conducted with parents, step-parents, siblings, and partners of the twins who were interviewed for the first time. The CFT 20-R test was programmed by TNS Infratest in preparation of the first wave. The same program was used in the second wave. The test was automatically controlled by the survey software on the CAPI laptop. The test was comprised of four parts: (a) similarity, (b) series continuation, (c) matrices and (d) topological conclusions. Whereas an extra minute of test time was announced as such during the CFT 1-R test, the timing in the CFT 20-R continued uninterrupted to the maximum of 5 minutes for test parts (a) and (b) and to the maximum of 4 minutes for test parts (c) and (d). The respondents therefore did not actively request the extra minute of test time.

¹³ Weiß (2006): CFT 20-R mit WS/ZF-R Grundintelligenztest Skala 2. Hogrefe Verlag, Göttingen in a programmed version from TNS Infratest, Munich.

¹⁴ One condition for a valid interview in the first survey wave was the participation of both twins and at least one parent.

4.5 Computer-assisted self-interview

After the computer-assisted personal interview (CAPI), which was administered by an interviewer, all respondents who were at least 10 years old¹⁵ answered a self-interview questionnaire on a tablet (CASI).

The CASI questionnaire featured complex filtering regarding the questions asked as well as text filters to control the phrasing of questions for different subgroups. For example, questions on problems during the transition from primary to secondary school were asked only if the children attended a secondary school. The question about attending school had already been answered on the laptop in the CAPI questionnaire. To ensure that this information – as well as other variables that were needed to control the questions asked in the CASI questionnaire – did not have to be asked again, this information was transmitted automatically to the tablet at the end of the CAPI questionnaire using an individual QR code.

First, the respondents were instructed by the interviewer on how to use the CASI tablets. Subsequently, the respondents could retreat to other rooms in the household to answer the questions in private. Nevertheless, the interviewer was always available for any queries. The CASI included questions on sensitive topics, such as the relationship to other members of the family, deviant behavior, (e.g., skipping school, stealing, smoking, drinking alcohol etc.) and health. Table 10 lists the question modules.

¹⁵ The twins in cohort 1 as well as siblings under 10 years of age therefore were not interviewed in the computer-assisted self-interviews.

Tabelle 10 Modules of the CASI personal questionnaire

Relationship questionnaire	Marital status
	Home environment
	Sibling relationship
	Life transitions
	Parent about child: Life transitions
	Frequency of contact between family members
	Parenting style

	Cultural capital
Activities with children	Activities with children

4.6 Paper-and-pencil self-administered interview

In addition to the computer-assisted self-interview using tablets, all respondents aged 10 years or older¹⁶ were also asked to complete a self-administered interview on paper. The paper-and-pencil questionnaire (PAPI) included questions on personality traits, risk tolerance and general life satisfaction (see table 11). Two versions of the paper questionnaire were used:

- Questionnaire for children between 10-15 years old,
- Questionnaire for adults aged 16 years or older.

Tabelle 11 Modules of the PAPI personal interview

Version for children 10-15 years old	Version for adults 16 years or older
Free time, interests and hobbies Time for reading, participation in political or cultural discussions, music	Free time, interests and hobbies Time for reading, participation in political or cultural discussions, music
Activities in clubs and groups Participation, involvement in voluntary work	Activities in clubs and groups Participation, involvement in voluntary work
Media use	Media use
Life satisfaction	Life satisfaction
Dealing with pressure and conflicts	Dealing with pressure and conflicts (as mother/father)
Self-assessment Statements on sensitivity, self-confidence, own abilities, risk tolerance and patience	Self-assessment Statements on sensitivity, self-confidence, own abilities, risk tolerance and patience
Estimation of own qualities	Life goals (wishes and likelihood)

¹⁶ The twins in cohort 1 as well as siblings under 10 years of age therefore were not interviewed in the paper-and-pencil self-administered interviews.

4.7 Interview duration

Since several personal interviews could be conducted at once, it is useful to differentiate between the instrument duration and the interview duration per family.

The instrument duration refers to the duration of the survey instruments on the individual level. However, in the TwinLife study, the total instrument duration of all family members does not correspond to the time required to interview a family, as the total instrument duration does not take the option of parallelization into account. Therefore, the interview duration per family states how much time was needed to conduct all interviews in a family.

Both, the instrument durations as well as the interview duration per family are reported below.

The total instrument duration (see tables 12 and 13) corresponds to the time needed for one respondent to be interviewed. The interview duration per family (see tables 14 and 15) takes into account that – especially in cohort 1 and 2 – the family members remain involved even after their own interview is completed, because other family members are still being interviewed in their home.

Tabelle 12 Characteristics of instrument durations (F2F 2a/b)

	Number of cases	Min.	Max.	Median	Mean (M)	Standard deviation (SD)
Family questionnaire	2,660	3.0	29.9	8.3	9.7	5.1
Household questionnaire	3,762	1.3	19.7	4.5	4.9	2.4
CAPI- interview	9,653	10.3	60.0	26.9	29.4	11.4
CASI-interview	7,975	10.0	59.9	27.5	29.5	11.0

Basis: Valid interviews with a valid time measure, time in minutes

Source: F2F 2a/b survey data

The total instrument duration on the individual level was comprised of the durations of the CAPI, CASI and PAPI questionnaires. Since no time measurements were available for the PAPI questionnaires, only the CAPI-interviews and the CASI-interviews are considered in the following tables. On average, another ten minutes per person need to be added for the PAPI questionnaire.

The instrument duration on the individual level (not counting the PAPI questionnaire) was 58.5 minutes on average. Table 13 shows how the instrument duration differs between the types of respondents. On average, the interviews with parents were longer than interviews with twins or siblings. This particularly affected the younger cohorts, because the parents gave information about themselves as well as their children.

Interviewing the partners of the twins took a particularly long time, as these were generally first-time interviews, which included both, the regular interview program as well as the cognitive test, which alone already took around 20 minutes.¹⁷

Tabelle 13 Interview duration on the individual level (without PAPI) by respondent type (F2F 2a/b)

	Number of cases	Min.	Max.	Median	Mean (M)	Standard deviation (SD)
Total	10,548	12.0	140.0	54.1	58.5	25.9
Twins	4,962	12.0	140.0	46.6	50.3	21.6
Siblings	1,003	12.4	138.8	50.9	56.2	26.8
Mother	2,350	13.4	139.6	68.7	70.9	26.5
Father	1,761	13.8	139.2	57.8	62.4	26.2
Step-parents	121	13.5	119.8	68.1	68.0	26.5
Partners of the twins	345	16.1	139.9	77.1	75.1	27.7

Basis: Valid interviews with valid time measure, time in minutes

Source: F2F 2a/b methodological data

As can be seen in table 14, on average, it took 172.4 minutes to interview a family (while interviewing multiple family members at once is already taken into consideration). The interviews of the families in cohort 4 took a particularly long time. In this cohort, the twins and siblings mostly no longer lived in the same households as the rest of their families. Therefore, many interviews were conducted in single-person households meaning that it was not possible to reduce the overall interview duration by conducting multiple interviews simultaneously.

¹⁷ 89 percent of the interviewed partners were surveyed for the first time in this data collection.

Tabelle 14 Interview duration of the families by age cohort (F2F 2a/b)

	Number of cases	Min.	Max.	Median	Mean (M)	Standard deviation (SD)
Total	2,706	21.5	466.4	162.3	172.4	69.2
Cohort 1	746	21.5	458.3	163.6	169.3	55.4
Cohort 2	747	27.9	459.7	159.0	166.2	55.9
Cohort 3	644	26.3	466.4	162.6	173.0	73.8
Cohort 4	569	22.6	460.8	172.4	183.8	91.3

Basis: Valid interviews with valid time measure, time in minutes

Source: F2F 2a/b methodological data

It was not possible to conduct interviews with all relevant family members in all families. The number of family members successfully interviewed therefore ranges from 1 to 8. The overall interview duration in families with two to three family members interviewed was an average of 131.6 minutes. In families with six to eight respondents, the interview took 297.8 minutes on average (see table 15).

Tabelle 15 Interview duration of the families according to number of family members interviewed (F2F 2a/b)

	Number of cases	Min.	Max.	Median	Mean (M)	Standard deviation (SD)
Total	2,706	21.5	466.4	162.3	172.4	69.2
1 respondent	110	21.5	257.2	48.7	61.5	37.1
2-3 respondents	570	41.7	451.4	125.1	131.6	49.8
4-5 respondents	1,929	63.6	466.4	173.6	184.4	59.3
6-8 respondents	97	124.7	460.8	299.5	297.8	73.5

Basis: Valid interviews with valid time measure, time in minutes

Source: F2F 2a/b methodological data

5 Conducting the survey

The design of the F2F survey intended for all respondents to be interviewed personally at their homes. However, it became evident during the fieldwork, particularly in cohorts 3 and 4, that the twins in these age groups were difficult to reach in person. In addition, there were families or individual respondents who were difficult to motivate in the F2F field and the only option was to conduct the interview by telephone.

In order to reduce drop-outs at the family or individual level due to design-related unavailability or refusal, it was decided to allow a mode switch to telephone interviews (CATI) at the end of the fieldwork phase.

A distinction was made between two target groups of the mode switch: families or individuals who were difficult to reach F2F and families and individuals who were difficult to motivate F2F (soft refusals). Soft refusals of the F2F field were informed in advance by letter that they would be contacted by telephone.

Both, whole families or individual family members were switched to the CATI-field. However, the switch could only be conducted for households with a valid telephone number.

Since the survey was not originally intended to be mixed-mode, the F2F instruments had to be adjusted for the telephone interview. Some of the CAPI instruments (family questionnaire, household questionnaire, and individual interview) had to be shortened for this. For example, it was not possible to collect the medical check-up booklets, to photograph the school reports, or to conduct the delayed gratification or the cognitive test. No adjustment was needed for the CASI-questionnaire. This questionnaire was conducted as an online interview (CAWI) following the telephone interview. For this, the respondents were asked in the telephone interview whether they would be willing to participate in the online survey. If permission was granted, the respondents' e-mail address was recorded and an e-mail was sent including a personal access link to the CAWI-questionnaire. The PAPI was enclosed in the thank you letter for the participants of the CATI interview.

5.1 Interviewer training

The study content and the complex interview instruments placed very high demands on the interviewers. This required the interviewers to be carefully selected and trained. All interviewers were given an intensive personal training specifically for the study.

Tabelle 16 Training sessions for F2F interviewers

Dates of the TwinLife interviewer training sessions	
F2F interviewers (inexperienced)	11/02-11/03/2016
F2F interviewers (inexperienced)	11/07-11/08/2016
F2F interviewers (inexperienced)	11/10-11/11/2016
F2F interviewers (inexperienced)	09/11-09/12/2017

The F2F interviewers were trained by the infas project management and the TwinLife team. Each interviewer participated in one 2-day training session. Four 2-day training sessions were held in total. Three training sessions were held before the F2F 2a interviews and one training session before the F2F 2b interviews. Interviewers, who had already taken part in the F2F 2a training and had conducted interviews in the F2F 2a survey, were required to conduct an interview for training purposes before the beginning of the F2F 2b survey but did not have to participate in the training again.

The training sessions introduced the content of the questionnaires as well as the technical instructions on the specifics of the study. Particular focus was laid on the succession of the individual interview components. The interviewers were also made aware of the importance of the family questionnaire for all of the subsequent interview components in the family. The focus of the second training day was laid on the technical specifications and handling of the CASI tablets. In practical parts of the sessions, the interviewers trained to conduct interviews in order to further develop their understanding of the specifics of each questionnaire component.

The details of the training sessions are presented below.

		<ul style="list-style-type: none"> - Final questions - Feedback round - Organizational matters and issuing of interview material 	

Furthermore, all interviewers received a study-specific interviewer handbook as well as a handout of the training presentation. The interviewer handbook contained all important information and explanations in writing so that it served as a reference during the field phase.

Prior to the mode switch, CATI interviewers also received training for the Twin-Life study. For this, only telephone interviewers were selected who had already conducted interviews in the CATI 1b or CATI 2a surveys and were therefore fa-

miliar with the TwinLife study. For these CATI interviewers, two briefings were held (one in preparation for F2F 2a and one for F2F 2b). In addition, the telephone interviewers received a handout of the training presentation as a reference.

5.2 Interviewer deployment

Only interviewers who had extensive experience in conducting interviews with longitudinal designs were selected for the TwinLife F2F interviews. Interviewers who had already conducted interviews during the F2F 2a survey were deployed again in the F2F 2b survey. Due to the fluctuation of interviewers¹⁸ and the regional distribution of addresses, an additional 20 TwinLife inexperienced interviewers were trained before the start of the F2F 2b survey.

110 F2F interviewers and 49 CATI interviewers conducted at least one interview in F2F 2a or F2F 2b. The number of female interviewers was a little higher than the number of male interviewers (women: 56.6 percent; men: 43.4 percent). Interviewers of all ages were deployed. On average, the CATI interviewers were younger than the F2F interviewers. More than half of the interviewers had been working for infas for at least four years.

¹⁸ 15 of the F2F 2a interviewers were not available in F2F 2b.

Tabelle 17 Characteristics of the deployed interviewers

Column %	Total		F2F		CATI	
	Abs.	%	Abs.	%	Abs.	%

Final school graduation/entry qualification for higher education	89	56.0	62	56.4	27	55.1

Basis: Interviewers deployed who conducted at least one interview in F2F 2a or F2F 2b /

Source: infas interviewer master file

As can be seen in table 18, the 110 F2F interviewers conducted a total of 10,434 individual interviews in F2F 2a and F2F 2b. The average was 95 interviews, with a maximum of 336 interviews being conducted by one interviewer.¹⁹ The 49 CATI interviewers conducted a total of 512 interviews with target respondents that switched from F2F to CATI in both subsamples. The average here was 11 interviews, with a maximum of 43 interviews being conducted by one interviewer.

¹⁹ The standard deviation is 57.8, i.e. there is a large variance among the interviewers.

Tabelle 18 Individual interviews per interviewer

	Number of interviewers	Number of interviews conducted	Min.	Max.	Mean (<i>M</i>)	Standard deviation (<i>SD</i>)
Total	159	10,946	1	336	68.8	62.1

5.3 Quality assurance and interviewer monitoring

Throughout the entire fieldwork phase, the interviewer performance was closely monitored.

In the **F2F field**, all interview data and contact data were continuously checked in regards to formal and content-related criteria. As part of the formal data check, the interview data was compared to the sample information (ensuring that the right target respondent was interviewed), and checks were conducted to ensure that the filtering was correct and the value ranges were valid. Another focus was to check whether all interview components (CAPI, CASI, PAPI, delayed gratification, school report photo, and cognitive test) were conducted.

In addition to the ongoing check of survey and contact data, an interviewer feedback form was used in the F2F field. For this, a short interviewer feedback questionnaire was enclosed in the thank you letter that was sent to the respondents following the interview. The feedback questionnaire was mainly used to ensure that the interviews were conducted correctly. However, TwinLife being a panel study, it was important to ensure that the respondents did not get a negative impression as a result of this control mechanism. The questionnaire therefore mainly included questions aimed at giving feedback on the interview (for example, whether the respondent enjoyed the interview). The feedback form could be returned to infas in a postage paid envelope. Of a total of 9,508 interviewer feedbacks sent out, 2,837 were answered.²⁰

The results did not give any indication of interviews being falsified or conducted disregarding the study specific standards. The overall respondents' assessments of the interview situation, as well as the interviewers themselves, indicated that the interviews were conducted well and that the TwinLife study itself is well respected. The results of the interviewer feedback questionnaires are described in more detail below.

In response to the question about the satisfaction with the interview (Did you like the interview?), the positive assessments "very good" and "good" made up 84.8 percent. There were negative assessments ("rather poor" and "poor") in only 3.4 percent of cases (see table 20).

²⁰ The interviewer feedback form was not sent to twins and siblings under 14 years of age. Furthermore, it was only sent to respondents of the F2F interviews

Tabelle 20 Assessment of the interview (only F2F)

<i>Column %</i>	Total	
	<i>Abs.</i>	<i>%</i>
Total	2,837	100.0
Very good	1,384	48.8
Good	1,021	36.0
So-so	324	11.4
Rather poor	80	2.8
Poor	18	0.6
No information/duplicate answers	10	0.4

In response to the question about the interviewer performance, the positive assessments “very satisfied” and “satisfied” made up 88.3 percent. Only 4.0 percent of the respondents gave a negative assessment (“rather dissatisfied” or “dissatisfied”) (see table 21).

Tabelle 21 Satisfaction with interviewer performance (only F2F)

<i>Column %</i>	Total	
	<i>Abs.</i>	<i>%</i>
Total	2,837	100.0
Very satisfied	1,797	63.3
Satisfied	708	25.0
So-so	217	7.7
Rather dissatisfied	84	3.0
Dissatisfied	27	1.0
No information/duplicate answers	4	0.1

In the **CATI field**, the quality of the interviews was monitored by trained supervisors who were very familiar with the specific methodical requirements of the survey as well as the CATI interviewing techniques. These supervisors were trained specifically for the TwinLife study by the project managers. Thus, they could answer any study-specific questions of the interviewers in close collaboration with the project management. The aim of the supervision was to maintain a high quality of the interview data and maximize the response rate of the study by providing ongoing support. The supervision tasks included the following:

- Monitoring the interviewers by listening to interviews in the telephone studio and reviewing the entries by observation on the supervision mask (viewing the interviewer's screen at the supervisor's workstation).

- Holding individual meetings or retraining sessions with the interviewers in case of any problems with the study.
- Holding individual and group meetings or retraining sessions directly after the interview if any problems were reported. Written feedback was also issued to the interviewers.
- Intervening directly in the interview in case of any errors or allocation difficulties that could lead to extensive errors in the data. This occurred either by providing short verbal or written information during the interview or direct intervention of the supervision if there were bigger problems and the interviewer became overwhelmed.

The supervision was performed during the whole fieldwork phase. A tight flow of information to the project management was maintained so that problems concerning the survey instruments could be solved as quickly as possible. Solutions were immediately distributed to the telephone studio.

5.4 Announcement and thank you letter

All families received a personal letter before they were contacted. The letter included information about the interview itself, the adherence of all relevant data protection laws, the voluntariness of the study participation as well as the monetary compensation for participation (10 euros).

In cohorts 1 and 2 (7-year-old and 14-year-old twins), the letters were addressed to the parents or guardians of the twins, since they were the ones first contacted for the interview. In cohorts 3 and 4 (19-year-old and 25-year-old twins), both twins received separate letters, regardless of whether they were living in the same household or not. In these families, the twins were therefore contacted directly.

The letter also stated that the family would be contacted by infas interviewers. Furthermore, a hotline free of charge and a study-specific email address were provided. The families were also referred to the study's website for more information. The letter was sent promptly before the start of the fieldwork.

In addition to announcing the interview and preparing the contact by the interviewers, the letter was also used for tracking the target person. By sending the letters in an envelope printed "If undeliverable, please return! If undeliverable, address correction card!" they were used to check addresses.

Additionally, any responses to the letter received via the study-specific e-mail address, the free hotline or via the online address portal were recorded and processed.

The TwinLife team also provided a newsletter containing results from the first wave. This newsletter was sent to the families together with the announcement letter and the data protection notice. The newsletter is also available on the study website.

To provide telephone numbers or new address information, families were referred to the study's online address portal, the study e-mail address as well as the hotline.

A data protection notice was also enclosed with the letter for the F2F 2a survey as these respondents were now interviewed by infas interviewers for the first time. This was not necessary for the F2F 2b survey as the families had already received the data protection notice before the CATI 1b survey.

Individuals or entire families who were not willing to participate in the F2F field (people difficult to motivate and soft refusals) were contacted in the CATI switch. Before the first phone contact, the respondents received a letter announcing the phone contact and aiming to motivate them to participate.

During the telephone interview, the respondents were asked whether they would be willing to complete an additional online questionnaire.²¹ If they agreed and gave an e-mail address, they received a personalized access link to the online questionnaire by e-mail immediately after the telephone interview.

Following the successful interview, all participants received a personal thank you letter including the incentive of ten euros in cash. For respondents of the CATI switch, the paper-and-pencil questionnaire was also included in this letter.

²¹ This was the computer-assisted self-interview that was completed on the tablet in the F2F field.

Tabelle 22 Overview of letter and thank you letter versions

Type of letter	Versions
First letter	Families in cohorts 1 and 2: A letter was sent to the parents or guardians of the twins incl. the data protection notice (only F2F 2a) ²² and the newsletter.
	Families in cohort 3 and 4: A letter was sent to both twins individually incl. the data protection notice (only F2F 2a) and the newsletter.
Conversion letter before CATI switch	Families in cohort 1 and 2 with soft refusal: A letter was sent to the parents or guardians of the twins.
	Families in cohort 3 and 4 with soft refusal: A letter was sent to both twins individually.
	Individual respondents aged 18 years and older with soft refusal in all four cohorts.
E-mail invitation online questionnaire	Participants from CATI switch who gave their consent to do the online survey.
Thank you letter	Participants from the F2F field: Twins and siblings in C1/C2 families: incl. ten euros in cash without access to the address portal.
	Participants from the F2F field: incl. ten euros in cash and personal access to the address portal (apart from twins and siblings in C1/C2).
	Participants from the CATI switch: to all respondents (apart from twins in C2) who softly refused to participate in F2F. Incl. ten euros in cash and personal access to the address portal with no paper-and-pencil questionnaire and no reminder about the online survey.
	Participants from the CATI switch: to the twins in cohort 2 incl. ten euros in cash with no access to the address portal, with no paper-and-pencil questionnaire and with no reminder about the online survey.
	Participants from the CATI switch: to all respondents (apart from twins in C2) who refused to answer the online survey. Incl. ten euros in cash and personal access to the address portal incl. paper-and-pencil questionnaire and with no reminder about the online survey.
	Participants from the CATI switch: to all respondents (apart from C2 twins) who agreed to take part in the online survey. Incl. ten euros in cash and personal access to the address portal incl. paper-and-pencil questionnaire and incl. a reminder about the online survey.
Panel maintenance during the fieldwork	2017 Easter card to all households (F2F 2a fieldwork time).
	Christmas card incl. raffle in 2017 to all households (F2F 2b fieldwork time).

Source: infas

5.5 Tracking during the fieldwork phase

In order to avoid mobility-related nonresponse and to achieve a maximum response rate from the panel sample, various tracking techniques were undertaken during the fieldwork phase. The respondents themselves were able to update their address using the study's hotline, e-mail address or the online address portal. The new information was then entered in the address database.

Furthermore, various tracking techniques were implemented throughout the fieldwork phase for the target respondents whose addresses were no longer cor-

²² The families of subsample b received the data protection notice before the CATI 1b survey.

rect. Initially, research was conducted using the address factory database of Deutsche Post AG. Subsequently, individual inquiries about changed addresses were submitted to the citizens' registration office. These measures were conducted each month throughout the entire fieldwork phase and after.

During the field period of the F2F 2a survey, an Easter card was sent to all households as a panel maintenance measure. During the field phase of the F2F 2b survey, a Christmas card incl. a raffle was sent to the households. These cards informed the respondents about the online address portal and asked them to provide information if their addresses had changed. Furthermore, households to which the card could not be delivered were immediately included in tracking techniques.

The central tracking techniques, such as research using the address factory database, were performed at the household level for all respondents in the household. Responses from the respondents via the hotline or the online address portal could either refer to a complete household or to a single person in the household.

During the field phase, tracking techniques were implemented for n=739 addresses (see table 23).

Tabelle 23 Tracking techniques during the fieldwork phase

	Total		F2F 2a		F2F 2b	
	Abs.	%	Abs.	%	Abs.	%

5.6 Fieldwork process

The field phase of the F2F 2a survey began on 11/07/2016 (CW 45) and ended on 09/29/2017 (CW 39). The CATI switch began on 05/03/2017 (CW 18) and ended on 09/29/2017 (CW 39). 5,414 individual interviews were conducted in the F2F 2a survey. 5,075 of these interviews were conducted F2F and 339 interviews by phone.

The field time of the F2F 2b survey lasted from 09/04/2017 (CW 36) to 05/27/2018 (CW 21). The CATI switch started on 04/23/2018 (CW 17) and ended on 05/27/2018 (CW 21). 5,532 respondents were interviewed in the F2F 2b survey. A F2F interview was conducted with 5,359 of these respondents. 173 respondents were interviewed by phone.

Figure 11 documents the individual interviews conducted during fieldwork. It shows the development of the total number of interviews throughout the fieldwork phase: the steeper the increase, the larger the increase of completed interviews. The weeks shown refer to the weeks after the start of the field work so that a comparison of both subsamples (F2F 2a and F2F 2b) is possible. The interviews conducted F2F are shown in purple and yellow. The light purple and orange represent CATI interviews.

Abbildung 11 Development of interviews conducted during the fieldwork phase (F2F 2a/b)

6 Fieldwork results

For each contact or contact attempt, the interviewers recorded the processing outcome according to a detailed return code specification.²³ However, depending on the contact history, the processing outcome from the last contact was not necessarily the final one. Therefore, the so-called final outcome was calculated and used in the following overviews.

The following shows the final outcome on the family level (chapter 6.1) as well as for the twins (chapter 6.2).

Furthermore, the outcomes for the other family members relevant to the survey (excluding the twins) are reported (chapter 6.3).

6.1 Final processing outcomes and response rates: families

The gross sample of the F2F 2 survey consisted of 3,900 families with 7,742 twins.²⁴ Among these, 1,914 families and 3,786 twins were included in the first subsample (F2F 2a) and 1,986 families with 3,956 twins in the second subsample (F2F 2b).

In 2,733 families, an interview was conducted with at least one respondent (70.1 percent). The response rate was highest in cohort 1 with 76.9 percent, while it was lowest in cohort 4 (63.0 percent). The two subsamples only show minor differences with regard to the number of interviews conducted. In the F2F 2a survey, at least one individual interview was conducted in 1,350 of the 1,914 families (70.5 percent). In the F2F 2b survey, at least one family member was interviewed in 1,383 of the 1,986 families (69.6 percent).

²³ Contact files with the entire contact history were handed over to the client.

²⁴ In 58 families, at least one twin refused to continue participating in the survey before the start of the fieldwork.

In total, 716 families (18.4 percent) refused to participate. The reasons for this being the following:

- 380 families refused to participate in the survey as a matter of principle, thereby revoking their willingness to participate in the panel survey. In terms of those who refused to participate, this corresponds to 53.1 percent. This percentage is particularly high in cohort 3, where the twins have come of age since the first interview.
- Another 153 families (21.4 percent of those who refused) decided to skip the current wave but were open to continue participating in the survey in the future.
- Other reasons for refusal included having no time (8.1 percent) and a lack of interest in the topic of the study (4.5 percent).

85 families could not be reached at all during the fieldwork phase, neither F2F nor by telephone. In terms of the gross sample, this corresponds to 2.2 percent. Another 8.0 percent of the families could be reached either personally or by telephone but no appointment could be arranged successfully within the fieldwork phase.

Tabelle 24 Final outcome: families (F2F 2a/b)

Families, that could not be reached personally by the interviewers or were difficult to motivate in the F2F field, were contacted by telephone at the end of the field time and asked to participate in a telephone interview (CATI switch).

A total of 709 families were switched to the CATI mode. The last processing status from the F2F field before the beginning of the CATI switch is documented in the tables 27-29.²⁷

In total, 512 individual interviews in 313 families could be conducted through the switch to the CATI mode. The data collection mode of the individual interviews is documented in chapters 6.2 and 6.3.

In addition to the unadjusted gross sample response rate, other measures also give important information about the field outcomes (see tables 33 to 35). The response rate describes the rate of families with at least one valid individual interview ($n=2,733$) from the gross sample minus those addresses outside the target group. The cooperation rate displays the number of successfully contacted families who decided to take part in the survey. The contact rate measures the number of families with whom verbal contact could be established during the fieldwork phase.

6.1.1 Number of target persons

The following family members are interviewed in the TwinLife study:

- Both twins,
- Both biological parents,
- Step-parents/partners of the biological parents provided they live in the same household as a biological parent,
- One sibling over 5 years of age (regardless of whether it is a full, half, adoptive or step-sibling),
- Current partners of the twins (only for twins over 18 years of age).

In the 2,733 families that took part in the survey, 13,162 target persons were identified. Thus, an average of 4.8 family members per family was to be interviewed, with a minimum of one and a maximum of nine.

Tabelle 36 Number of target persons per family (F2F 2a/b)

	Number of families	Number of target respondents	Min.	Max.	Mean (M)	Standard deviation (SD)
Total	2,733	13,162	1	9	4.8	1.0
Cohort 1	747	3,278	2	7	4.4	0.6
Cohort 2	749	3,399	3	7	4.5	0.6
Cohort 3	649	3,324	3	9	5.1	1.1
Cohort 4	588	3,161	1	9	5.4	1.2

Source: F2F 2a/b methodological data

The average number of target persons was higher in cohorts 3 and 4 because the partners of the twins also were to be interviewed.

6.1.2 Number of households

In the 2,733 families, the target persons were distributed over an average of 1.8 households per family. The number of households with target persons ranged from one to seven households per family.

Tabelle 38 Number of households with target persons per family (F2F 2a/b)

	Number of families	Number of households	Min.	Max.	Mean (M)	Standard deviation (SD)
Total	2,733	4,984	1	7	1.8	1.2
Cohort 1	747	819	1	3	1.1	0.3
Cohort 2	749	853	1	3	1.1	0.4

Cohort 4	588	1,881	1	7	3.2	1.2

Source: F2F 2a/b methodological data

As expected, the families of age cohorts 3 and 4 were distributed over more households than the families of underaged twins (cohort 1 und 2). While 90.8 and 87.2 percent of all families in cohorts 1 and 2, respectively, consisted of only one household, the share of one-household-families dropped to 34.4 percent in cohort 3 and 8.3 percent in cohort 4.

6.1.3 Completeness of families

In 57.1 percent of the 2,733 families interviewed, all target persons in the families were successfully interviewed. The percentage of complete families was particularly high in cohorts 1 and 2. As expected, it was more difficult to conduct interviews with all family members of the adult twins (cohorts 3 and 4).

6.2 Final processing outcomes and response rates: twins

The sample of the F2F 2 survey consisted of 3,900 families with 7,742 twins. Among these, 1,914 families with 3,786 twins belonged to the first subsample (F2F 2a) and 1,986 families with 3,956 twins to the second subsample (F2F 2b). In 58 families, one or both twins had objected to the transfer of their address or had withdrawn their consent to participate in the panel. In consultation with the TwinLife team, the other family members of these twins were still contacted and interviewed.

Overall, 5,076 twins were interviewed (65.6 percent). A valid individual interview implies that at least the personal interview administered by the interviewer (CAPI/CATI) was completed. The completeness of the different interview components (CASI, PAPI, cognitive test, delayed gratification experiment) is reported in chapter 6.2.2.

171 of the 5,076 twin interviews were conducted by telephone as part of the CATI switch (3.4 percent of the interviews conducted).²⁸

There are significant differences between the four age cohorts with regard to the response rate:

In cohort 1, an interview was conducted with 1,441 of the 1,944 twins. This corresponds to a response rate of 74.1 percent. In cohort 2, 73.8 percent of 1,986 twins were interviewed. Since the twins were underaged, the initial contact in these age cohorts was always with a parent. Only twins for whom a parent had already completed the family and household questionnaire were interviewed. With regard to the n=3,004 twins (age cohorts 1 and 2) for whom the family and household questionnaire had been answered, the interview rate was 96.7 percent.

In cohort 3, however, only 59.9 percent of the twins were interviewed and in cohort 4 only 53.7 percent.

The reasons for nonresponse also vary between the age cohorts.

²⁸ During the CATI switch, 709 families were contacted by telephone. Furthermore, 123 individual twins whose family members had already been interviewed in the F2F field, were contacted by telephone.

The main reason for non-response among the twins in cohorts 1 and 2 was that their parents did not participate: 23.6 percent of the twins could not be interviewed on these grounds. Only 0.5 percent of the twins in cohorts 1 and 2 personally refused to participate although the parents had participated. 43 of the twins could not be reached during the field time or an appointment could not be arranged (1.1 percent). In cohort 1, 36 twins could not be interviewed because their families were contacted by telephone. As the twins in cohort 1 were only 7 years old at the time of the interview, they were not interviewed if the family had switched to the CATI mode.

In cohorts 3 and 4, 942 of the twins (24.7 percent) refused to participate:

- 482 twins in cohorts 3 and 4 refused to participate as a matter of principle, thereby revoking their willingness to participate in the panel survey. In terms of those who refused to participate in cohorts 3 and 4, this corresponds to 51.2 percent.
- Another 196 twins in cohorts 3 and 4 (20.8 percent of those who refused) decided to skip the current interview.
- Other reasons for refusal included having no time (6.9 percent) and a lack of interest in the topic of the study (5.9 percent).

169 twins in cohorts 3 and 4 could not be reached at all during the fieldwork phase, neither F2F nor by phone. In terms of the gross sample, this corresponds to 4.4 percent. Another 12.6 percent of the adult twins could be reached either personally or by telephone but no appointment could be arranged within the fieldwork phase.

³¹ The families of the 18 twins were switched in the CATI field. Twins in cohort 1 were not interviewed by telephone due to their age.

6.2.1 Completeness of twin pairs

3,900 twin pairs were to be interviewed in the second F2F survey (F2F 2a/b). 58 of these twin pairs were already incomplete in the gross sample, as one of the twins had withdrawn their willingness to participate in the panel. Of the remaining 3,842 twin pairs, both twins were interviewed in 2,422 twin pairs (63.0 percent). The completeness of twin pairs is considerably higher in cohorts 1 and 2 at around 73 percent than among the adult twins. There were no differences between the first and second subsample with regard to completeness.

6.2.2 Regional characteristics

Since no information about the distribution of twins according to regional characteristics is available from official statistics, statements about the distribution of twins according to federal state, BIK municipality type and political municipality size are only possible in comparison to the gross sample of the survey. The regional characteristics always refer to the twins' current place of residence and not to the place of residence at the time of sampling. It must also be noted that the sampling in wave 1 was carried out with a disproportional design.³² Furthermore, the twins in cohorts 3 and 4 are a very mobile group due to their age so that changes to the regional distributions are to be expected during the panel.

The regional distribution of the interviewed twins very closely resembles the distribution of the gross sample.

³⁸ The regional characteristics refer to the twins' current place of residence.

6.2.3 Completeness of the interview components

6.2.3.1 Self-administered questionnaires

The interviewer-administered interview (CAPI or CATI) was conducted with 5,076 twins.

In addition to the interviewer-administered questionnaires (CAPI/CATI) the 3,633 interviewed twins in cohorts 2, 3 and 4 were also asked to complete self-administered questionnaires (SAQ). This included a computer-assisted self-interview (CASI or CAWI) as well as a paper-and-pencil self-administered interview (PAPI). Due to their age, the twins of age cohort 1 did not answer any self-administered questionnaires.

The rate of completed SAQs can be considered as exceptionally high: More than 92 percent of the interviewed twins answered both the computer-assisted and the paper-and-pencil questionnaire. The percentage of completed SAQs was particularly high in cohort 2 (94.1 percent), while it was a little lower in cohort 3 with 90.7 percent.

6.2.3.2 School report photos

Twins who went to school at the time of the interview or had completed general education since the last interview were also asked to provide their last yearly school report so that it could be photographed by the interviewer. A parent was asked for consent for twins under 18 years of age.

The school reports of twins interviewed by telephone (CATI switch) were not photographed.

Of the 5,076 interviewed twins, the school reports of 3,850 twins had to be photographed (75.9 percent). A photo of the school report is available for 1,960 of these twins (50.9 percent). In 27.5 percent, either no consent was given to photograph the school reports or the reports were not available. Furthermore, there were twins who had not yet received their yearly school report.

If the school report could not be photographed, questions for grades in Math and German were implemented in the questionnaire.

6.2.3.3 Experiment: Delayed gratification in cohort 1

The delayed gratification experiment was only conducted with the twins in cohort 1, provided a parent had given consent and the children liked gummy bears. The aim of the experiment was to measure the ability to resist an immediate reward in order to receive a larger reward at a later point.

For 1,237 of the cohort 1 twins (85.8 percent), the parents had given their consent and the children liked to eat gummy bears. The experiment was conducted with over 97.2 percent of these 1,237 twins. In 2.8 percent of cases, the experiment was not conducted as the twins themselves refused to take part.

6.3 Final processing outcomes and response rates: other family members

In addition to the twins, also parents, step-parents, partners of the twins and a sibling over 5 years of age were interviewed in the second F2F survey. In the 2,733 families with a completed family questionnaire, 7,874 family members (not counting the twins) were identified as target persons. Among those were 5,148 parents, 232 step-parents, 1,505 siblings and 989 partners of twins.

Source: F2F 2a/b methodological data

Therefore, 5,870 of the 7,874 family members identified by the family questionnaire as target persons were successfully interviewed. This corresponds to a response rate of 74.5 percent. The rate differs between the family members. The response rate was highest for the biological parents (83.5 percent) while interviewing siblings and partners of the twins proved to be more difficult (57.8 percent for the siblings and 37.4 percent for the partners of twins).

6.3.1 Interviews in the CATI switch

709 families were switched from F2F to telephone interviews because they could not be reached or were difficult to motivate (soft refusals). In addition to these 709 families, 980 individual family members were also contacted. These individuals were part of families who were successfully interviewed in the F2F field. Here, the mode-switch to CATI therefore served for completing the families.

After the CATI switch, 341 family members (twins excluded) were interviewed. This included many siblings and partners of the twins. Out of a total of 1,073 interviewed siblings, 6.6 percent were interviewed by telephone. The rate of CATI interviews for the partners of the twins even exceeded 10 percent. The interviews with mothers and fathers, on the other hand, were conducted less frequently by telephone (4.7 and 5.8 percent, respectively).

The following tables document the distribution of the interviews conducted in the CATI field according to the different respondent types. The reason for the low number of telephone interviews in the F2F 2b survey is the considerable shorter field time of the CATI switch. The CATI field in the F2F 2a survey was open for several months, while the CATI field in the F2F 2b survey only lasted four weeks.

6.3.2 Completeness of the interview components

6.3.2.1 Self-administered questionnaires

The interviewer-administered interview (CAPI or CATI) was conducted with 5,870 family members (not counting the twins).

Respondents that were aged 10 years or older were also asked to complete self-administered questionnaires (SAQ). This included a computer-assisted self-interview (CASI or CAWI) and a paper-and-pencil self-administered interview (PAPI)

The number of completed SAQs is slightly lower among the other family members than among the twins (88.3 vs. 92.4 percent), but can still be considered high. Only for about 3.4 percent of the family members, no SAQ is available.

6.3.2.2 School report photos

The interviewed siblings who still went to school at the time of the interview or who had received their school leaving qualification since the last interview were asked permission to have their last yearly school report or qualification photographed. For underaged siblings, this consent was obtained from the parents. A school report photo was requested from 900 of the 1,073 interviewed siblings (83.9 percent). The photo was obtained from 51.7 percent of these 900 siblings. In 31.8 percent of cases, the parents refused to give consent to photograph the school report and for 8.7 percent no yearly report was available.

6.3.2.3 Cognitive test

During the first F2F interview (F2F 1), a test to determine basic intelligence was conducted with all respondents. In this data collection, the tests were only conducted with respondents who had not been included in the first interviews. Of the 5,870 interviewed family members there were 856 first-time respondents. Among these, 123 respondents were interviewed via telephone (CATI switch), so the cognitive test could not be conducted due to the design. Of the 733 respondents intended for the cognitive testing, the test was conducted in 91.7 percent of the cases.

Source: F2F 2b methodological data

There are only minor differences in the completeness of the cognitive test between the different family members. However, only 75.6 percent of all targeted mothers completed the test. This might be explained by the mothers' involvement in the children's interviews making it particularly difficult for them to find time to answer the test.

7 Interview situation

Interviewer questions were to be answered by the interviewer in each household. In the interviewer questions, various areas of the respondents' lives were to be assessed and questions were asked about the process and any problems that occurred while conducting the interviews in the household. If several visits were necessary to interview a household, the questions were asked several times. These interviewer questions were not asked in the interviews that were conducted via telephone (CATI switch).

The following analyses refer to 3,080 households from the F2F 2a and F2F 2b survey, for which valid interviewer comments are available. Duplicate comments were not considered here.³⁹

Due to the specificity of the interview in the family context, those interviewer comments that point to possible interventions by other family members in an interview are of particular interest. Even if the family members were asked by the interviewers not to interfere in the interviews of others, this could not always be avoided in the family context. The interventions included help concerning any comprehension problems as well as discussing the given answers.

The interviewers reported only a few cases in which the parents intervened in the survey of the twins (see table 85) or siblings (see table 86). With regard to all households, only 5.2 percent of the parents intervened in the twins' interview and 2.4 percent in the siblings' interview. Even after excluding the households in which parents and twins or siblings were not interviewed at the same time, the percentage of intervention was still low (6.3 percent and 3.5 percent respectively).

Tabelle 85 Intervention of the parents in the twins' interviews

Source: F2F 2a/b survey data

Even though multiple interviews were conducted simultaneously, the interviewers reported only few interventions of the children and parents among each other (see tables 87 and 88).

Source: F2F 2a/b survey data

Furthermore, there were concerns beforehand that particularly the younger twins might try to impersonate their twin brother or sister in the interview situation. The interviewers were instructed to resolve this in a playful way by using name tags if this situation arose. However, only eight attempted cases of impersonating were reported (see table 89).

Tabelle 89 Interviewer assessment: Twins' attempts to impersonate one another

Column %	Total		F2F 2a		F2F 2b

Basis: 3,080 interviewed households (F2Fa/b) with valid interviewer comments

Source: F2F 2a/b survey data

The interviewers were also asked to state how often respondents indicated that the interview was taking too long. In about 12 percent of the households this was expressed at least sometimes. While the length of the interview was a common reason given by respondents revoking their willingness to participate in the panel, respondents seem to rarely express this in the interview situation (see table 90).

Tabelle 90 Interviewer assessment: Respondents found the interview to be too long

8 Data processing and data delivery

The survey data was managed on the basis of different analysis levels (family, household and person). The levels are always clearly assigned using a family and a household number. All data sets can be linked.

The survey data was stored in a total of 11 different data records according to the various analysis units and survey methods:

- **Family questionnaire:** information from the family questionnaire; each person confirmed or newly included in the family questionnaire is represented as one case
- **Family questionnaire open answers:** open information from the family questionnaire for each person in the family questionnaire
- **Household questionnaire:** household data from the household questionnaire
- **Household questionnaire open answers:** open information from the household questionnaire
- **Interviewer questions** at the household level: Interviewer questions incl. reports of disruption and problems during the interview
- **CAPI/CATI individual data:** CAPI and CATI interview data at the individual level
- **CAPI/CATI individual data open answers:** open information from the CAPI and CATI survey data
- **CASI/CAWI individual data:** Survey data from the computer-assisted self-interviews at the individual level
- **CASI/CAWI individual data open answers:** open information from the computer-assisted self-interview
- **PAPI data: 16 years and older:** Survey data from the paper-and-pencil questionnaire for adults aged 16 and older
- **PAPI data: children:** Survey data from the paper-and-pencil questionnaire for children between 10 and 15 years of age

The file names, variable names as well as the value labels are based on the questionnaire.

Before the data was delivered to the TwinLife team, it underwent extensive checks in regard to formal and content-related criteria. As part of the formal data check, the interview data was compared to the sample information (ensuring that the right target respondent was interviewed), checks were conducted for duplicate personal numbers and implausible short interview durations. Additionally, the results from the interviewer feedback form were taken into account.

In all of the computer based instruments (CAPI/CATI and CASI/CAWI) extensive plausibility checks were programmed so that any implausibility was already noticed and potentially resolved during the interviews. A range of longitudinal checks was also specified by the TwinLife team. These checks referred to, for example, a lower highest training qualification than in the first interview, deviations in school classes or in nationality as well as bigger deviations in body dimensions. This comparison was carried out based on the survey data from the first F2F data collection. A flag variable was created for each reviewed variable. Further processing of this information was carried out by the TwinLife team.

The open text information on the occupation and industry of the respondents was coded according to the International Standard Classification of Occupations from 2008 (ISCO 08) and the Classification of Economic Activities (WZ 08). The highest training qualifications were also coded according to the International Standard Classification of Education (ISCED 1997). Open plain-text information that could not be clearly assigned was documented in a separate variable. The open plain-text information was also delivered to the TwinLife team, separately from the survey data. The encoding was done in-house by trained personnel. All assigned codes were checked randomly for plausibility. Furthermore, the frequencies and distributions of the assigned codes were checked. For all cases of doubt arising from machine coding, the non-machine coding was conducted by two coders (in order to ensure intercoder reliability).

During the F2F 2a and F2F 2b survey, an unreviewed interim data delivery was conducted in the middle of each fieldwork phase.

The final data records were handed over at the end of the fieldwork phase using a secure exchange server.

In addition to the survey data, the data records on contact history were also delivered at the end of the fieldwork phase. These contain the entire contact history (with details such as contact date, type and person) at the family, the household and the individual level.

Additionally, a methodological data set was prepared in close consultation with the TwinLife team.

TwinLife – Deutschlandweite Zwillingsfamilien-Studie zur Entwicklung unterschiedlicher Lebenschancen

Sehr geehrte Eltern,

Sie und Ihre Familie haben ja bereits an der deutschlandweiten Zwillingsfamilien-Studie „TwinLife“ teilgenommen, die im Auftrag der Universitäten Bielefeld und Saarbrücken jetzt vom infas Institut für angewandte Sozialwissenschaft GmbH in Bonn durchgeführt wird. Sie haben freundlicherweise zugesagt, dass wir uns bei Ihnen melden dürfen. Dafür nochmals herzlichen Dank.

Nun ist es wieder soweit!

In den nächsten Wochen wird eine Mitarbeiterin oder ein Mitarbeiter von infas mit Ihnen Kontakt aufnehmen, um mit Ihrer Familie einen Termin für einen Hausbesuch zu vereinbaren. Wie Sie es schon aus der ersten persönlichen Befragung kennen, sollen auch diesmal wieder die Zwillinge, Sie als Eltern sowie weitere Personen aus Ihrer Familie befragt werden.

Zusammen mit unserer Mitarbeiterin bzw. unserem Mitarbeiter stimmen Sie die Termine so ab, wie es für Sie und Ihre Familie am besten passt.

Warum ist Ihre erneute Teilnahme so wichtig?

Die erneute Teilnahme Ihrer Familie ist für die Qualität und Verlässlichkeit der Studie unersetztlich. Nur so können wir die Fragestellungen der Untersuchung umfassend beantworten und es kann ein vollständiges Bild über die Lebenssituation von Zwillingen entstehen. Die Teilnahme an der Befragung ist freiwillig und alle Regeln des Datenschutzes werden eingehalten. Weitere Ausführungen können Sie dem beiliegenden Datenschutzblatt entnehmen.

Was haben Sie davon?

Als kleines Dankeschön für die Teilnahme Ihrer Familie möchten wir uns mit jeweils **10 Euro für jede befragte Person** erkenntlich zeigen, die wir allen im Anschluss an die Befragung zusenden.

Haben Sie noch Fragen?

Für Rückfragen steht Ihnen bei infas Ihre persönliche Ansprechpartnerin Frau Sabrina Torregroza unter der **kostenfreien Telefonnummer 0800/73 84 500** zu den üblichen Bürozeiten gerne zur Verfügung. Nutzen Sie bei Fragen auch unse-

TwinLife

Erklärung zum Datenschutz und zur absoluten Vertraulichkeit Ihrer Angaben

Das infas Institut für angewandte Sozialwissenschaft in Bonn und das Forscherteam des Projekts TwinLife, angesiedelt an der Universität Bielefeld und der Universität des Saarlandes, führen zusammen die wissenschaftliche Studie „TwinLife – Deutschlandweite Zwillingsfamilien-Studie zur Entwicklung unterschiedlicher Lebenschancen“ durch. Alle beteiligten Institutionen arbeiten streng nach den gesetzlichen Bestimmungen des Datenschutzes.

Ihre Teilnahme an der Studie ist freiwillig. Die Ergebnisse der Befragung werden ausschließlich in anonymisierter Form, d.h. ohne Namen und Kontaktdaten dargestellt.

Das bedeutet: Niemand kann aus den Ergebnissen erkennen, von welcher Person diese Angaben gemacht worden sind.

Dies gilt auch bei den Wiederholungsbefragungen, bei denen es wichtig ist, nach einer bestimmten Zeit noch einmal ein Interview mit derselben Person durchzuführen. Die statistischen Auswertungen werden so vorgenommen, dass die Angaben aus mehreren Befragungen nur durch eine Codenummer, also ohne Namen und Adresse, miteinander verknüpft werden.

Es gibt keine Weitergabe von Daten an Dritte, die Ihre Person erkennen lassen.

Für die Einhaltung der Datenschutzbestimmungen sind verantwortlich:

Auf der Rückseite dieser Erklärung zeigen wir Ihnen den Weg Ihrer Daten vom Interview bis zur völlig anonymen Ergebnistabelle.

5604/2016/DS

Was geschieht mit Ihren Angaben?

- 1 Ihre Antworten werden im Computer durch Eingabe der zutreffenden Angabe in Form von Ziffern erfasst. Bei Interviews mit einem Papierfragebogen werden Ihre Angaben ebenfalls in Zahlen umgesetzt und durch infas elektronisch erfasst.
- 2 Ihre Angaben werden ausnahmslos ohne Ihren Namen oder Ihre Kontaktdaten (also in anonymisierter Form) gespeichert.
- 3 Die Namen und Kontaktdaten werden ausschließlich bei infas gespeichert, eine Speicherung bei den beteiligten Universitäten findet nicht statt. Bei infas werden Namen und Kontaktdaten strikt von den Interviews getrennt und nach Abschluss der Untersuchung gelöscht.
- 4 Anschließend werden alle Fragebögen (ohne Namen und Kontaktdaten) ausgewertet. Der Computer zählt z.B. alle Antworten zur Frage zur Erwerbs situation und errechnet daraus die Prozentergebnisse.
- 5 Das Gesamtergebnis und die Ergebnisse für Teilgruppen (z.B. Männer, Frauen) werden in Tabellenform ausgedruckt. Angaben einzelner Personen sind nicht erkennbar.
- 6 Auch bei der Wiederholungsbefragung werden Ihr Name und Ihre Kontaktdaten stets von den Daten des Interviews getrennt.

Beispiel

In welcher Situation befinden Sie sich derzeit? Sind Sie ...	
erwerbstätig?	<input type="checkbox"/> 1
arbeitslos?	<input type="checkbox"/> 2
in Ausbildung?	<input type="checkbox"/> 3
Hausfrau/Hausmann?	<input checked="" type="checkbox"/> 4
im Ruhestand?	<input type="checkbox"/> 5
Sonstiges?	<input type="checkbox"/> 6

	Männer	Frauen	Gesamt
Erwerbstätig	60,9%	50,8%	55,5%
Arbeitslos	3,4%	2,8%	3,1%
Ausbildung	3,5%	2,5%	3,0%
Hausfrau/Hausmann	0,4%	11,2%	6,2%
Ruhestand	29,1%	30,0%	29,5%
Sonstiges	2,7%	2,7%	2,7%
Gesamt	100%	100%	100%

In jedem Fall gilt:

Ihre Teilnahme am Interview ist freiwillig.

Bei Nichtteilnahme entstehen Ihnen keine Nachteile. Es ist selbstverständlich, dass alle gesetzlichen Bestimmungen des Datenschutzes eingehalten werden.

Sie können absolut sicher sein, dass wir...

- Ihren Namen und Ihre Kontaktdaten nicht mit Ihren Interviewdaten zusammenführen, so dass niemand erfährt, welche Antworten Sie persönlich gegeben haben;
- Ihren Namen und Ihre Kontaktdaten nicht an Dritte weitergeben;
- keine Einzeldaten, die einen Rückschluss auf Ihre Person zulassen, an Dritte weitergeben;
- die Daten ausschließlich zu Forschungszwecken nutzen werden.

Wir danken für Ihre Mitwirkung und für Ihr Vertrauen in unsere Arbeit!

Eine genetisch informative Längsschnittstudie zur
Entwicklung unterschiedlicher Lebenschancen

Newsletter

10/2016

Der TwinLife-Newsletter ist da!

*Herzlichen Dank an alle teilnehmenden Familien für die
bisherige Unterstützung!*

TwinLife

... ist ein gemeinsames Projekt der Universität des Saarlandes und der Universität Bielefeld, das durch die Deutsche Forschungsgemeinschaft (DFG) gefördert wird. WissenschaftlerInnen der Fachbereiche Psychologie, Soziologie und Verhaltensgenetik arbeiten dabei in einem interdisziplinären Team zusammen. Ziel ist die Erforschung von sozialen Mechanismen und genetischen Unterschieden, die sozialer Ungleichheit zugrunde liegen.

Schön, dass Sie dabei sind und dieses Projekt unterstützen!

Jede einzelne Familie leistet durch ihre Teilnahme einen wertvollen Beitrag für die Wissenschaft und macht die Forschung erst möglich.

Was war & wie geht es weiter?

In der TwinLife Studie wechseln sich jedes Jahr Haus- und Telefonbefragungen ab – wie Sie unter „Der Studienverlauf im Überblick“ sehen können.

Alle teilnehmenden Familien hatten mittlerweile einmal Besuch eines Interviewers oder einer Interviewerin von TNS Infratest. Bei dieser Hausbefragung wurden die Zwillinge, Eltern und in vielen Fällen auch ein Geschwisterkind zu verschiedenen Themen befragt. Im November 2016 startet die zweite Hausbefragung für die Zwillingsjahrgänge 1990/1991, 1997, 2003 und 2009 mit einem neuen Fragenprogramm und auch unserem neuen Erhebungsinstitut *infas*.

Für Sie – die Familien der Zwillingsjahrgänge 1992/1993, 1998, 2004 und 2010 – geht es als nächstes mit dem Telefoninterview weiter. Dabei sollen alle Personen, die über 10 Jahre alt sind telefonisch befragt werden.

Der Studienverlauf im Überblick

Die Erhebung über mehrere Jahre hinweg erlaubt das Erforschen von Entwicklungsverläufen ab der frühen Kindheit bis ins Erwachsenenalter. Daher ist für uns von zentraler Bedeutung, die Familien über einen mehrjährigen Zeitraum begleiten zu dürfen.

Geburtsjahr	2014	2015	2016	2017	2018	2019	2020	2021	2022	2023
'91/'97/'03/'09	Haus	Tele								
'92/'98/'04/'10	Haus				Haus		Haus			

Erste Ergebnisse

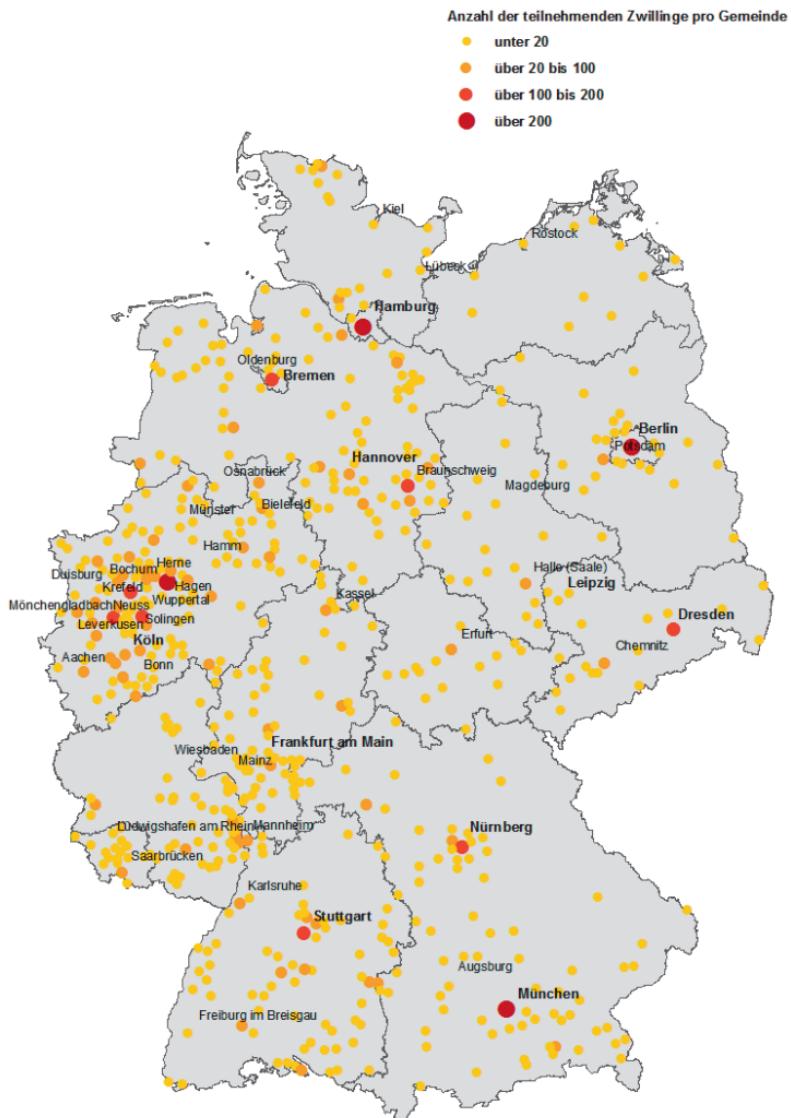

Einige Informationen über die teilnehmenden Familien haben wir im Folgenden für Sie zusammengestellt.

Über die teilnehmenden Familien

Ein zentrales Anliegen der TwinLife Studie ist es, anhand der teilnehmenden Familien möglichst aussagekräftige Rückschlüsse auf die Gesamtbevölkerung ziehen zu können. Daher ist es wichtig, dass Familien unterschiedlicher sozialer und ethnischer Herkunft, mit verschiedenen Lebensstilen, Werten und Überzeugungen teilnehmen.

Bisher beteiligen sich bundesweit 4.093 Familien an TwinLife, das sind insgesamt 18.832 Personen: Zwillinge, Eltern und Stiefeltern, Geschwister und Partner der Zwillinge.

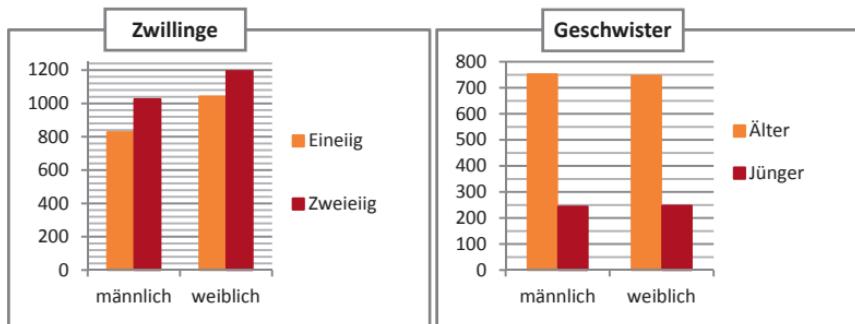

Verteilung der Zwillinge über Deutschland

Über die Zwillinge und Geschwister

Um den Einfluss und das Zusammenspiel von Genen und Umwelt untersuchen zu können, sind die Zwillinge und ihre Geschwister von zentraler Bedeutung.

Für diese Untersuchungen brauchen wir gleich viele eineiige und zweieiige sowie gleich viele männliche und weibliche Zwillingspaare. Die nachfolgende Graphik mit dem Titel „Zwillinge“ verdeutlicht, dass dieses angestrebte Gleichgewicht ausreichend gegeben ist.

Der Vergleich ein- und zweieiiger Zwillinge ermöglicht es, genetische und umweltbedingte Einflüsse getrennt voneinander zu betrachten. Die Hinzunahme von Geschwistern, die – ebenso wie zweieiige Zwillinge – etwa die Hälfte ihrer Gene mit den Zwillingen teilen, ermöglicht es, den Einfluss unterschiedlicher Umwelten zu untersuchen, da die Geschwister zu einem anderen Zeitpunkt in der Familie aufwachsen als die Zwillinge. So kann der Beitrag von Genen und Umwelt, aber auch deren Zusammenwirken bei der Entstehung sozialer Unterschiede erforscht werden.

Das Leben der Zwillinge

Auf unsere Frage „*Versuch(t)en Sie (als Eltern) die Zwillinge so gleich wie möglich zu kleiden?*“ gaben 49% aller Eltern an, dies zu tun oder getan zu haben. Weitere 9% erklärten, die Kleidung der Zwillinge aufeinander abzustimmen bzw. abgestimmt zu haben, während 42% angaben, die Zwillinge niemals gleich zu kleiden oder dies je getan zu haben.

Etwa 64% der Zwillingspaare besuch(t)en die gleiche Grundschulklasse. Dieser Anteil lag in der 5. bis 10. Klasse nur noch bei 54%, wobei die meisten Zwillinge (80%) zumindest die gleiche Schule besuch(t)en. In der Oberstufe besuch(t)en fast gleich viele Zwillinge die gleiche Klasse, unterschiedliche Klassen auf der gleichen oder verschiedenen Schulen.

	Gleiche Klasse	Verschiedene Klassen, gleiche Schule	Verschiedene Schulen
Grundschule	64 %	33 %	3 %
5. bis 10. Klasse	54 %	26 %	20 %
Oberstufe	37 %	31 %	32 %

Viele Eltern stellen sich die Frage, ob sich der Besuch der gleichen oder getrennter Klassen negativ auf die Schulleistung der Zwillinge auswirken könnte. Die bisherige Forschung zeigt, dass Unterschiede in der Leistung von Zwillingen nicht darauf zurückzuführen sind, ob diese in die gleiche oder verschiedene Klassen gehen.

Die Frage „*Teilen die Zwillinge (aktuell) in etwa die gleichen Hobbies und Interessen?*“ wurde von 6503 (Stief-)Elternteilen beantwortet. Die Mehrheit (66%) bejahte diese Frage, 34% antworteten mit „Nein“ oder gaben an, dass dies früher so gewesen sei, heute aber nicht mehr. In 2426 Fällen beantworteten zwei (Stief-)Elternteile diese Frage. Davon waren sich 82% einig, während in 18% die Antworten verschieden ausfielen.

Infobox – Wussten Sie schon...?

Bei Zwillingssgeburten unterscheidet man zwischen **Zygotie** (Eiigkeit der Zwillinge) und **Chorionizität** (Anzahl der vorliegenden Plazenten).

Das Vorliegen nur einer Plazenta bei Schwangerschaft und Geburt belegt eindeutig die Eineiigkeit der Zwillinge.

Beim Vorhandensein von zwei Plazenten hingegen, können die Zwillinge sowohl ein- als auch zweieiig sein!

Viele weitere wissenswerte Informationen zum Thema „Zwillinge“ finden Sie auf unserer Webseite.

Die Eiigkeit der Zwillinge

Bei insgesamt 2224 Zwillingspaaren wurde die Zygotie bereits durch medizinisches Personal eingeschätzt. Für 115 dieser Paare lag zusätzlich eine genetische Eiigkeitsbestimmung vor.

Der Vergleich der Eiigkeitsbestimmung mittels Fragebogen mit der genetischen Analyse fiel zufriedenstellend aus: Etwas mehr als 90% der Zwillinge wurden richtig klassifiziert. Auch stellten wir die DNA-Ergebnisse der Aussagen des medizinischen Personals gegenüber: In 24% waren diese nicht deckungsgleich. Bei genauerer Betrachtung zeigte sich, dass alle zweieiigen Zwillinge durch medizinisches Personal richtig als solche erkannt, eineiige aber in 39% fälschlich als zweieiig eingestuft wurden. Dieses Ergebnis ist verständlich, da medizinisches Personal häufig die Anzahl der vorliegenden Plazenten zur Zygotie-Bestimmung heranzieht. Zudem verglichen wir die Fragebogenergebnisse mit den medizinischen Aussagen: Diese stimmten in 14% nicht überein, wobei wieder vor allem bei eineiigen Zwillingen die Übereinstimmung fehlte.

Beste Grüße vom TwinLife Team, aus...

Newsletter

09/2017

Der neue TwinLife-Newsletter ist da!

*Herzlichen Dank an alle teilnehmenden Familien für Ihre
Unterstützung!*

TwinLife ... und aktuell?

Seit 2014 haben sowohl die TeilnehmerInnen als auch das TwinLife-Team viel erlebt. Die erste Haushaltsbefragung sowie das erste Telefoninterview sind erfolgreich abgeschlossen und einige Familien beteiligen sich bereits an der zweiten Phase der Haushaltsbefragung – vielleicht sind Sie ja eine davon? Wir möchten uns an dieser Stelle nochmals dafür bedanken, dass Sie sich die Zeit nehmen, um bei TwinLife mitzumachen. Für uns ist es nämlich von zentraler Bedeutung, dass wir die teilnehmenden Familien über einen längeren Zeitraum hinweg begleiten dürfen. Das erst macht es uns möglich, die Entwicklungsverläufe von der frühen Kindheit bis ins Erwachsenenalter zu erforschen.

Während Sie uns als TeilnehmerIn unterstützen, arbeiten die MitarbeiterInnen in TwinLife an der Organisation, Datenaufbereitung und -auswertung. Seit Oktober 2016 stehen die TwinLife-Daten der ersten Haushaltsbefragung der wissenschaftlichen Gemeinschaft zur Verfügung. Nun können auch andere ForscherInnen wissenschaftliche Fragestellungen mit den TwinLife Daten bearbeiten. Natürlich werden die Daten ausschließlich anonym weiter gegeben und ausgewertet.

TwinLife Mitarbeiterin der ZIF – Forschungsgruppe 2015/2016 „Genetische und soziale Ursachen von Lebenschancen“ Fotografin: Alexandra Polina, Bielefeld

Wer unsere Aktivitäten auf der Homepage verfolgt, wird zudem wissen, dass wir viele Personen innerhalb und außerhalb der Wissenschaft für unser Projekt begeistern konnten. Neben einer großen Medienresonanz waren wir dieses Jahr mit unseren Forschungsergebnissen auf zahlreichen Konferenzen im In- und Ausland vertreten.

Auch kooperieren wir mit diversen Wissenschaftlern aus aller Welt, wie zuletzt im Rahmen einer Forschungsgruppe am Zentrum für interdisziplinäre Forschung der Universität Bielefeld (ZIF).

ZIF – Forschungsgruppe 2015/2016, *Genetische und soziale Ursachen von Lebenschancen*;
Fotografin: Alexandra Polina, Bielefeld

Insgesamt erhält das TwinLife-Team sehr viel positives Feedback zur Studie, wofür wir Ihnen „Danke“ sagen möchten! Wir hoffen, dass Sie die gemeinsame Zeit im Projekt genauso positiv wahrnehmen wie wir. Um Ihnen noch mehr Einblicke in unsere Arbeit zu ermöglichen, finden Sie auf den nächsten Seiten in paar Auszüge aktueller Forschungsprojekte im Rahmen der TwinLife-Studie.

Behandeln Eltern ihre Kinder unterschiedlich?

Ob Eltern ihre Kinder unterschiedlich behandeln, ist eine heikle Frage. Fragt man Eltern danach, verneinen sie das eher. Kinder hingegen berichten häufiger, dass Eltern schon Unterschiede in der Erziehung machen. Bei Geschwistern hängt das auch damit zusammen, dass sie unterschiedlich alt sind. Aber auch wenn wir die Verhaltensweisen der Eltern zu den Zeitpunkten vergleichen würden, an dem die Geschwister im gleichen Alter waren, würden wir Unterschiede im Verhalten der Eltern feststellen können. Dies liegt daran, dass sich die Eltern häufig in verschiedenen Lebenssituationen befanden, also eventuell unterschiedlich viel Zeit, Geld und andere Ressourcen für die Erziehung der Kinder zur Verfügung hatten.

Wie ist es aber bei Zwillingen? Da fallen solche wechselnden Umstände, die Unterschiede im Elternverhalten ausmachen können, ja zu einem großen Teil weg. Hier zeigt sich, dass Eltern ihre Zwillings-Kinder in der Tat eher gleich behandeln, auch aus Sicht der Kinder. Das gilt zumindest für die jeweils empfundene emotionale Wärme, die Zuwendung und das Setzen von Regeln. Darüber hinaus haben wir untersucht, ob Eltern ihre Zwillingskinder unterschiedlich stark unterstützen, je nachdem ob sie annehmen, dass ein besonderer Bedarf besteht. Konkret haben wir uns angeschaut, ob Eltern auf ein niedriges Geburtsgewicht mit einem Mehr an gemeinsamen Aktivitäten reagieren, etwa zusammen singen, musizieren, Bücher lesen, oder auch sportliche Aktivitäten. Das alles sind Aktivitäten, die helfen können, die Entwicklung eines Kindes gezielt zu fördern. Im Vergleich zwischen Familien zeigen unsere Ergebnisse, dass Eltern hier kompensierend reagieren, das heißt, dass Eltern bei einem vergleichsweise geringen Geburtsgewicht versuchen den vermuteten Entwicklungsrückstand ihrer Kinder durch ein Mehr an Aktivitäten auszugleichen.

Bild: Katrina Elena/Shutterstock.com

Innerhalb von Familien werden jedoch, bei einem unterschiedlichen Geburtsgewicht der Zwillinge, überraschenderweise mit dem vergleichsweise kräftigeren Kind mehr Aktivitäten unternommen. Warum das so ist, darüber können wir im Augenblick nur spekulieren. Möglicherweise ist es schlicht so, dass sich kräftigere Kinder tendenziell schneller entwickeln und entsprechend früher und häufiger solche Aktivitäten einfordern oder auf entsprechende Angebote der Eltern stärker reagieren. Die Daten der weiteren Erhebungswellen werden es uns mit Ihrer Unterstützung ermöglichen, diese Entwicklungsprozesse noch genauer zu verstehen.

TwinLife: ForscherInnen im Portrait

Anke Hufer, M.Sc.-Psych.

Hallo, ich bin Anke Hufer. Seit Oktober 2016 bin ich Teil des TwinLife-Teams an der Universität Bielefeld. Nach meinem Psychologiestudium an den Universitäten Düsseldorf und Kassel von 2010 bis 2015 hatte ich weiterhin große Lust auf Forschung und so habe ich mich dazu entschieden zu promovieren. Für meine Doktorarbeit bieten besonders die vielfältigen TwinLife-Daten eine gute Basis.

In einem großen Projekt wie TwinLife gibt es die unterschiedlichsten spannenden Aufgaben, beispielsweise die Zusammenstellung und Optimierung der neuen Befragungsprogramme. Daneben führe ich Analysen zu verschiedenen Themen durch. Die Möglichkeiten dazu sind, dank der vielen Fragen, die wir unseren Teilnehmerinnen und Teilnehmern stellen durften, ganz vielfältig: Momentan liegen meine Forschungsschwerpunkte bei politischen Einstellungen und Teilhabe sowie dem Selbstwert. Es interessiert mich sehr, welche Einflüsse die Gene und die Umwelt auf diese Merkmale haben und ich bin gespannt, welche Entwicklungen unsere Zwillinge und ihre Familien im Laufe des Befragungszeitraums erleben werden. Ich freue mich schon auf hoffentlich noch viele schöne, aufregende und lehrreiche Jahre als Teil der TwinLife-Familie!

Schullaufbahn und Schulnoten: Gene haben unterschiedliches Gewicht

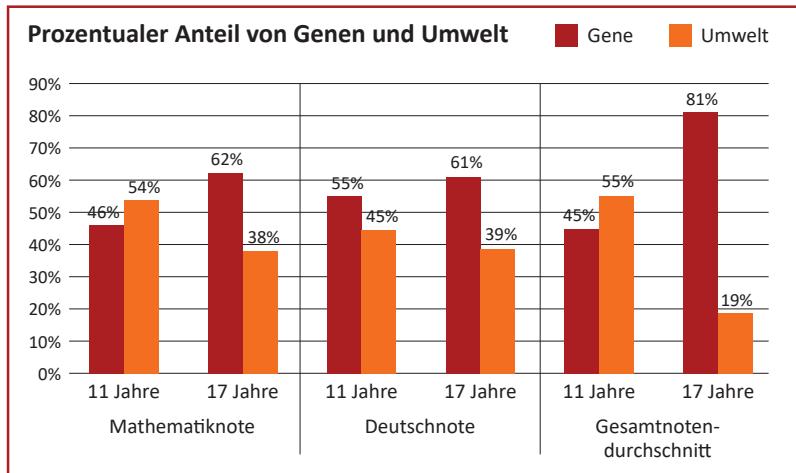

Schulische Leistungen (Noten) und erreichte Schulabschlüsse stehen im engen Zusammenhang mit späteren sozialen Chancen und Ungleichheiten. Sie beeinflussen berufliche Möglichkeiten, die sozialen und finanziellen Lebensumstände sowie letztlich auch unsere psychische Gesundheit. Deshalb interessiert uns, wie Unterschiede in Schulnoten zustande kommen und welchen Einflüssen sie unterliegen. Um das herauszufinden, haben wir die Noten in Mathematik und Deutsch sowie den Gesamtnotendurchschnitt der Zwillinge aus den Jahrgängen 1997/98 und 2003/04, von denen fotografierte Zeugnisse vorlagen, untersucht. Da insbesondere die älteren Zwillinge eine Vielzahl verschiedener Schultypen besuchen, beschränkten wir unsere Analysen in den beiden Altersgruppen auf die am häufigsten besuchten Schultypen (11 Jahre, Grundschule und Gymnasium; 17 Jahre, Gymnasium und Gesamtschule). Dadurch, dass wir Zwillingss Familien untersuchen, sind wir in der Lage zu bestimmen, zu welchem Anteil Unterschiede in Schulnoten auf genetische und Umwelteinflüsse zurückzuführen sind.

Bild: Andrii Vodolazhskyi/Shutterstock.com

Die Ergebnisse zeigen, dass insbesondere in der älteren Altersgruppe Gene einen großen Teil der Unterschiede in den Schulnoten erklären können. Offenbar spielt das genetische Potential im Alter von 17 Jahren eine größere Rolle, und die Noten sind weniger stark durch förderliche oder hinderliche Einflüsse von außen geprägt. Ein starker genetischer Effekt bedeutet aber keineswegs, dass schulische Leistungen festgelegt oder unveränderlich sind. Unsere Gene beeinflussen ein Potential, dass auch durch unsere Umwelt mitbeeinflusst werden kann. Genetik und Umwelt bedingen sich zudem gegenseitig, sodass davon auszugehen ist, dass vor allem in jungen Jahren, durch beispielsweise Förderangebote, eine gute Basis für die Entwicklung von schulischen Fähigkeiten gegeben werden kann. Und natürlich gilt auch hier – ebenso wie wir es vom Sport kennen – dass wir, ohne unser Potential zu entwickeln und zu trainieren, nichts erreichen können.

Neben den Schulleistungen ist es natürlich besonders wichtig, welchen Schultyp die Zwillinge besuchen. Erste Analysen, in denen der Besuch eines Gymnasiums dem Besuch eines anderen Schultyps gegenübergestellt wird (weil viele Zwillinge ein Gymnasium besuchen), zeigen, dass hierfür

in deutlich stärkerem Ausmaß Umwelteinflüsse verantwortlich sind (72% Umwelt, 29% Gene). Insbesondere familiäre Einflüsse sind hier von großer Bedeutung. Im Umkehrschluss bedeutet dies, dass dem genetisch stärker beeinflussten Potential der Schüler bei den Entscheidungen zur Schullaufbahn nur eine vergleichsweise geringe Bedeutung zukommt.

TwinLife-Kreuzworträtsel (mit Verlosung)

Dieses Kreuzworträtsel dreht sich rund um das Thema „TwinLife“. Die Antworten zu den Fragen können mithilfe der TwinLife-Website (www.twin-life.de) gefunden werden. Hier bietet sich außerdem die Möglichkeit zu erfahren, was TwinLife überhaupt ist und welche spannenden Forschungsthemen hier untersucht werden sollen.

Teilnahmebedingungen

Um an der Verlosung teilzunehmen, muss eine E-Mail mit dem vollständigen Namen des Teilnehmers/der Teilnehmerin sowie dem richtigen Lösungswort an folgende Adresse geschickt werden: twinlife@uni-bielefeld.de. Einsendeschluss ist der 01. November 2017. Die Teilnahme ist kostenlos.

Die Teilnahme an der Verlosung richtet sich ausschließlich an Teilnehmer der TwinLife-Studie, die das 14. Lebensjahr vollendet haben. Die Angaben aus der Verlosung werden nicht mit den Befragungsdaten in Verbindung gebracht. Alle weiteren Teilnahmebedingungen finden Sie unter www.twin-life.de.

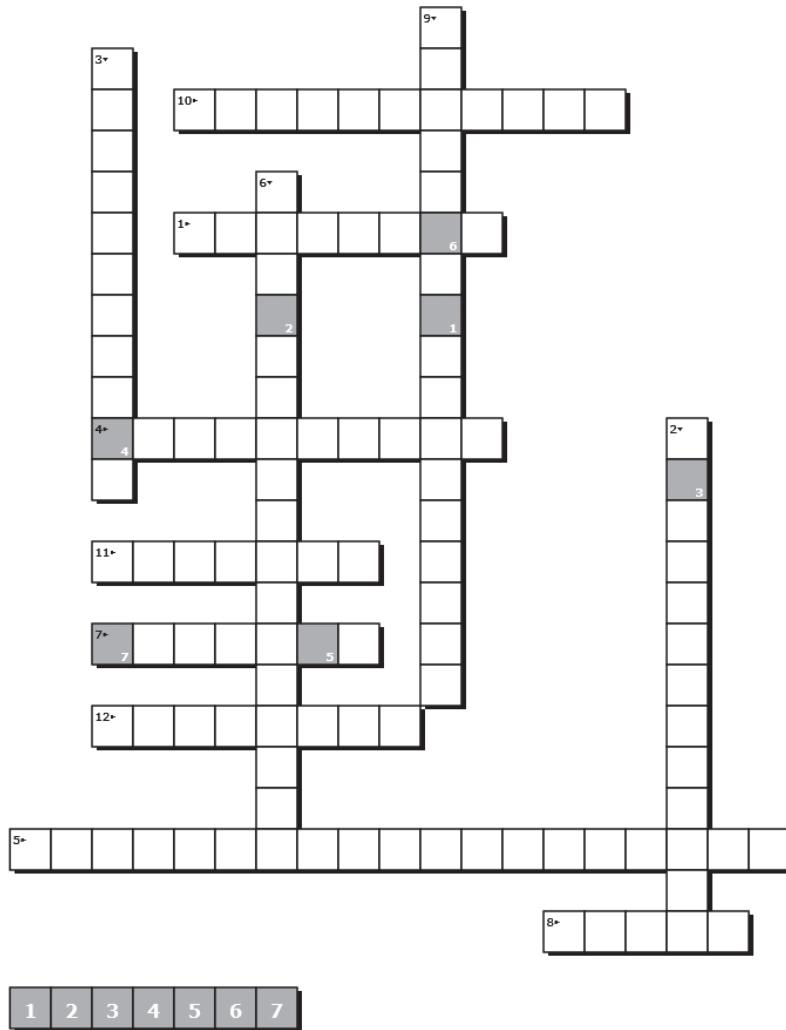

Folgende Preise werden nach Ablauf der Einsendefrist vergeben:

- 1. BestChoice Einkaufsgutschein über 75 € (1)**
- 2. BestChoice Einkaufsgutschein über 50 € (1)**
- 3. BestChoice Einkaufsgutschein über 25 € (1)**

Es besteht kein Anspruch auf Barauszahlung. Der Rechtsweg ist ausgeschlossen.

1. Zweieiige Zwillinge teilen durchschnittlich ___ Prozent ihrer Gene.
2. Ziel der Studie ist es, Aufschluss über die Entstehung von ___ zu geben.
3. Ein Umweltfaktor (Relationen zwischen Menschen).
4. Eineiige Zwillinge gleichen sich in ihren ___.
5. Ein Studiendesign, das die gleichen Personen zu verschiedenen Testzeitpunkten untersucht nennt man ___.
6. Die Studie wird über Besuche direkt bei den Familien und durch ___ durchgeführt.
7. Wie nennt man einen Geburtsjahrgang in der Forschung?
8. Eineiige Zwillinge könnten auch als natürliche ___ bezeichnet werden.
9. Durch künstliche Befruchtung kommt es häufiger zu ___.
10. Kenngröße, die angibt, wie stark Unterschiede zwischen Personen von genetischen Faktoren abhängen.
11. Wie wird die Eigkeit von Zwillingen in der Fachsprache genannt?
12. Trennt sich eine befruchtete Eizelle in zwei Teile, entstehen ___ Zwillinge.

1 2 3 4 5 6 7

Wir hoffen, dass wir auch in Zukunft auf Sie zählen können und freuen uns auf die weitere Zusammenarbeit!

TwinLife – Deutschlandweite Zwillingsfamilien-Studie zur Entwicklung unterschiedlicher Lebenschancen

Liebe/r <Vorname> <Nachname>,

wir danken Ihnen ganz herzlich, dass Sie sich für die „TwinLife“-Studie Zeit genommen und uns bei dieser wichtigen Studie unterstützt haben!

Als Dankeschön erhalten Sie mit diesem Brief auch die versprochenen **10 Euro**.

Etwa in einem Jahr findet die nächste Befragung im Rahmen der Studie statt, dann wieder am Telefon. Vor dem Start werden wir uns wie immer melden. Selbstverständlich ist auch dann die Teilnahme wieder freiwillig.

Für das Gelingen unserer Studie ist es sehr wichtig, Sie weiterhin erreichen zu können. Daher bitten wir Sie, uns Änderungen Ihrer Adresse oder Telefonnummer mitzuteilen. Bitte nutzen Sie dazu unser TwinLife-Online-Portal unter www.twinlife.infas.de. Anbei Ihr persönlicher Zugangscode:

(Bindruck Zugangscode Adressportal)

Selbstverständlich können Sie uns Ihre Kontaktdaten auch über unsere **kostenfreie Telefonnummer 0800/73 84 500** oder per E-Mail über twinlife@infas.de übermitteln. Für Rückfragen steht Ihnen Frau Sabrina Torregroza bei infas gerne zur Verfügung.

Weitere Informationen zum Thema Zwillinge und den Hintergrund der Studie finden Sie unter www.twin-life.de.

Wir wünschen Ihnen eine gute Zeit!

TwinLife – Deutschlandweite Zwillingsfamilien-Studie zur Entwicklung unterschiedlicher Lebenschancen

Sehr geehrte Eltern,

bitte sehen Sie uns nach, dass wir Sie heute erneut um Ihre Teilnahme an unserer deutschlandweiten Zwillingsfamilien-Studie „TwinLife“ bitten möchten. Wir hatten Sie schon einmal kontaktiert, damals ist es leider nicht zu einem Interview gekommen.

Da wir für unsere Forschung auf die Unterstützung jeder einzelnen Familie angewiesen sind, würden wir es sehr bedauern, Sie nicht befragen zu können. Daher bieten wir Ihnen an, das Interview diesmal telefonisch durchzuführen. Eine Mitarbeiterin oder ein Mitarbeiter von infas wird sich in den kommenden Tagen melden, um einen Termin für ein telefonisches Interview mit Ihnen zu vereinbaren. **Als kleines Dankeschön für das telefonische Interview möchten wir uns mit jeweils 10 Euro für jede befragte Person erkenntlich zeigen, die wir allen im Anschluss an die Befragung zusenden.**

Ihre Teilnahme ist natürlich freiwillig. Jedoch bitten wir Sie herzlich um Ihre Mitwirkung. Wir garantieren, dass Ihre Angaben wie immer vertraulich behandelt und alle Regeln des Datenschutzes strengstens eingehalten werden. Alle Ergebnisse werden ausschließlich ohne Namen und ohne Anschrift dargestellt. Niemand kann aus den Ergebnissen erkennen, von welcher Person die Angaben gemacht wurden.

Hinweise auf Ihre telefonische Erreichbarkeit nehmen wir gerne auf. Sie erreichen uns unter der **kostenfreien Telefonnummer 0800/73 84 500** oder per E-Mail: **twinlife@infas.de**. Dort beantworten wir Ihnen auch gerne alle weiteren Fragen zur Studie.

Wir freuen uns, wenn wir Sie doch noch für die Teilnahme an dieser wichtigen Studie gewinnen können!

TwinLife – Deutschlandweite Zwillingsfamilien-Studie zur Entwicklung unterschiedlicher Lebenschancen

Liebe/r <Vorname> <Nachname>,

wir danken Ihnen ganz herzlich, dass Sie sich für die „TwinLife“-Studie Zeit genommen und uns bei diesem wichtigen Forschungsprojekt unterstützt haben!

Als Dankeschön erhalten Sie mit diesem Brief auch die versprochenen **10 Euro**.

Etwa in einem Jahr findet die nächste Befragung – diesmal wieder am Telefon – statt. Vor dem Start werden wir uns wie immer bei Ihnen melden. Selbstverständlich ist auch dann die Teilnahme wieder freiwillig.

Für das Gelingen unserer Studie ist es sehr wichtig, Sie weiterhin erreichen zu können. Daher bitten wir Sie, uns Änderungen Ihrer Adresse oder Telefonnummer mitzuteilen. Bitte nutzen Sie dazu unser TwinLife-Online-Portal unter www.twinlife.infas.de. Anbei Ihr persönlicher Zugangscode:

(Bindruck Zugangscode Adressportal)

Selbstverständlich können Sie uns Ihre Kontaktdaten auch über unsere **kostenfreie Telefonnummer 0800/73 84 500** oder per E-Mail über twinlife@infas.de übermitteln. Für Rückfragen steht Ihnen Frau Sabrina Torregroza bei infas gerne zur Verfügung.

Weitere Informationen zum Thema Zwillinge und den Hintergrund der Studie finden Sie unter www.twin-life.de.

Wir wünschen Ihnen eine gute Zeit!

Mit freundlichen Grüßen

**TwinLife – Deutschlandweite Zwillingsfamilien-Studie zur Entwicklung
unterschiedlicher Lebenschancen**

Liebe/r <Vorname>,

wir sagen ganz herzlich

Dankeschön

dass Du Dir für die „TwinLife“-Studie Zeit genommen und uns bei diesem wichtigen und spannenden Projekt unterstützt hast!

Mit diesem Brief bekommst Du auch die versprochenen **10 Euro**. Vielleicht hast Du ja einen Wunsch, den Du Dir damit erfüllen kannst.

Wenn Du mehr zum Thema Zwillinge oder über die Studie erfahren möchtest, dann findest Du dazu im Internet unter www.twin-life.de viele Informationen, die auch Dich interessieren könnten.

Wir wünschen Dir eine gute Zeit!

Viele Grüße

**Liebe Zwillinge, liebe Eltern,
liebe Geschwister und liebe Angehörige,**

wir möchten uns ganz herzlich für Ihre Teilnahme an der TwinLife-Studie bedanken. Ihre verlässliche Unterstützung leistet einen enormen Beitrag für unsere Forschung zur Entstehung von sozialer Ungleichheit.

Um noch einfacher und schneller in Kontakt zu treten, können Sie Ihre Emailadresse und/oder Änderungen Ihrer Anschrift in unserem Online-Adressportal unter www.twinlife.infas.de eintragen, so dass wir Sie in Zukunft auch per E-Mail erreichen können.

Außerdem berichten wir nun auf unserer Website (www.twin-life.de) über noch mehr aktuelle Ergebnisse der Studie und teilen spannende Fakten über das Zwillingssleben, Bilder und Videos mit Ihnen. Weiterhin stehen wir Ihnen auf diesem Wege natürlich für Fragen, Probleme, Kritik und Anregungen jeglicher Art zur Verfügung.

Wir wünschen Ihnen eine schöne und erholsame Sommerpause!

Sonnige Grüße,

Ihr TwinLife-Team
